85.177	Delay	Model	The CODAS information should be incorporated into the models developed (FLAPS and DELAYSIM) for the evaluation of the airside improvements at Logan. CODAS...should be considered in lieu of The Airport Machine.	Because the FAA and U.S. DOT delay statistics, including CODAS, only record historical delays, the FAA requires delay modeling when evaluating the future delay reduction benefits of airport capital improvements. This analysis indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels.
85.178	Delay	Model	It is unclear why Massport chose to develop its own model for estimating delay when FAA has developed a model to do the very same.	DELAYSIM is a unique model that simulates how Air Traffic Control uses an airport's runways over time based on actual weather patterns and expected demand conditions. The FAA does not have an equivalent model, but uses a simplified (and less precise) procedure of weighting delays based on percentage of time different weather conditions exist. Refer also to response to Comment 85.46.
85.179	Delay	Model	The models have not been verified or compared with historical information nor has it been shown that the development has been coordinated with FAA or the airlines.	Refer to first paragraph of Comment 85.46. The airlines were represented on the Airside Review Committee, an integral and active part of the Airside Project public process.
85.180	Delay	Model	Questions dates of hourly weather observation used and changes due to El Nino and La Nina.	Refer to response to Comment 85.5.

Code	Topic 1	Topic 2	Comment	Response
85.181	Delay	Model	One of the assumptions of the DELAYSIM model is that an air traffic controller first chooses 1) highest capacity configuration, 2) the configuration that most closely meets the PRAS goals. We believe this assumption is not supported by historical data ...	The DELAYSIM model uses the same logic for choosing a runway configuration as PRAS. First, the runways must be available given the current wind and weather. Second, the runways should be able to accommodate the projected demand for the hour in question (this may not be possible given the weather conditions). Finally, if multiple configurations meet these criteria, the selection attempts to maximize both short-and long-term PRAS goals without excessive controller workload. Annual goal conformance has improved since the Revised PRAS was installed in 1993, and Runway 14/32 would provide controllers with considerably more flexibility to achieve the PRAS annual goals in the future as well as enabling them to increase short-term relief. Refer also to response to Comment 85.20.
85.182	Delay	Model	No data is presented to show recent improvement due to the availability of Enhanced PRAS (EPRAS).	Refer to response to Comment 85.11.
85.183	Delay	Model	The DELAYSIM model should withdraw the PRAS goal decision-point as a runway configuration selection criteria and provide the model results using, as the leading criteria, the highest capacity configuration and air traffic controller workload weightings approved by FAA ATC.	Refer to response to Comment 85.47.
85.184	Delay	Model	For the model to assume the attainment of PRAS goals will improve significantly is unrealistic ...	Runway selection is constrained by weather conditions and demand characteristics, and it is unlikely that all eleven-runway end use goals can be attained in a given year. Annual goal conformance has improved since the revised PRAS was installed in 1993, and Runway 14/32 would provide controllers with considerably more flexibility to meet the PRAS annual goals in the future and enable them to increase short-term relief.
85.185	Delay	Model	The methodology of the DELAYSIM model as applied by Massport provides output that reflects a "best-case" though unrealistic scenario, and warps the follow-on analysis of the environmental issues.	The DELAYSIM model is based on what is believed to be a realistic attainment of PRAS with Runway 14/32. DELAYSIM represents the most refined model available for estimating long-term airfield operational use and delays. It is based on actual weather patterns, realistic demand variations, and validated airfield capacity under all foreseeable operating conditions. DELAYSIM models the FAA runway selection hierarchy of weather/wind, demand and then noise, and also includes controller workload constraints. The model was used to evaluate a set of operating scenarios representing the foreseeable range of Logan Airport's air traffic. The results of the operations and delays modeling provided inputs for sound environmental assessments.
85.186	Delay	Model	The assumptions made by the DELAYSIM model do not account for stimulative effect that would occur if these improvements are implemented.	Refer to responses to Comments 85.1, 85.16 and 85.17.
85.187	Delay	Model	Measurement of capacity and delay benefits requires that the relationship depicted in Figure 3-2 be determined for both the existing system and the proposed new one.	Figure 3-2 in the Airside Project Draft EIS/EIR is merely a conceptual diagram, but since the airfield improvements do not increase normal operating capacity of 120 operations per hour, the same relationship holds for the both existing and proposed situations.

Code	Topic 1	Topic 2	Comment	Response
85.188	Alternatives	Runway 14/32	Since FAA includes recognition of the stimulation effect in determining delay reduction, the model Massport uses should do the same.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated by passenger or airlines, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts examined in the airside operational and environmental analyses would capture any potential variation in future passenger and aircraft activity at Logan Airport.
85.189	Delay	Model	The FAA Technical Center at Atlantic City, New Jersey, should assist in simulating operations of the proposed new runway to verify the validity of the sole-source models used by Massport.	Refer to 85.46.
85.190	Delay	Model	[Concerned that] Massport's Airside Improvement Project proposal will not preclude increases in the delay experienced by airlines and their passengers. ... [and] building and operating a unidirectional Runway 14/32 is but a band-aid.	Refer to response to Comment 85.13.
85.191	Analysis Assumptions/ Methodologies	Forecasts	...[the] statement that if no actions are taken, Logan's annual runway and taxiway delays will rise... and exceed...today's modeled level.. High Fleet scenario ignores the multitude of other factors that would affect industry and passenger decisions.	The 45 million-passenger level was the highest traffic volume examined in the analysis and represents upper bounds for environmental impact analysis. As a result, undue weight was not given to the 45M High Fleet scenario in evaluating the comparative benefits of airside alternatives.
85.192	Delay	Model	The DEIS/DEIR indicates that "in 1998, it is estimated that Logan experienced approximately 121,000 hours of runway delay," ... the 121,000 hours of delay was generated by Massport's model and not by FAA. Presentation of this data, without reference, is misleading.	Refer to response to Comment 85.46. The methodology used for the Airside Project provides a consistent and systematic estimate of flight delays caused by constraints at Logan Airport. The analysis based on this methodology indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels.
85.193	Analysis Assumptions/ Methodologies	Base Year	FAA calculated and reported delay at Logan has decreased almost 19% between 1993 and 1998. This information is not in DEIS/DEIR.	Refer to response to Comment 85.4.
85.194	Delay	Model	The DEIS/DEIR indicates that Logan's delay is six times the FAA's threshold; however, this analysis is flawed since the 121,000 hours of delay are measured by a different method than FAA's measurement.	Although the methodologies for measuring delays may differ, both are designed to indicate the severity of the delay problem at Logan Airport. FAA statistics consistently rank Logan Airport as one of the nation's most delayed airports.

Code	Topic 1	Topic 2	Comment	Response
85.195	Delay	Model	DELAYSIM, the model used for the Logan Airside Planning Project, overestimates the amount of delay hours.	Refer to response to Comment 85.46. In fact, the FAA models tend to overstate delays since they use weighted averages rather than continuous weather conditions.
85.196	Delay	Model	Massport exaggerates the cost of delay to airport users (airlines) and airport passengers. ... by counting cancelled flights.	The FAA considers avoided flight disruptions, along with delay reductions, safety improvements and cost savings, as the primary benefits of aviation investments. Cancelled flights, often because of delay conditions, represent a real cost to passengers and airlines. The cost is modeled by estimating the delays that would be incurred if the flight were not cancelled.
85.197	Delay	Model	Massport also assumes that all passengers can be represented by a single "representative passenger" when economically there are different economic values for business versus pleasure travelers. ...	The cost of delay analysis presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is based on a methodology recommended by the FAA. The cost of delay to a passenger ($27 per hour) is a weighted average cost for business and leisure passengers. Refer to FAA APO Bulletin APO-97-1.
85.198	Delay	Model	The generalized use of $27 per passenger overestimates the value of delay for airline passengers at Logan.	Refer to response to Comment 85.197.
85.199	Delays	Costs	Massport ... indicated cost information would not be provided except the initial construction cost of the project.	A cost-benefit analysis was not used to select among the various alternatives. The cost of delay information was presented to provide context to the delay problem at Logan Airport.
85.200	Environmental Review Process	MEPA	If cost information is to be presented as part of the analysis process for the DEIS/DEIR, a full cost-benefit analysis should be provided.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
85.201	Analysis Assumptions/ Methodologies	Base Year	... the selection and justification of 1993 as the base year ... is inappropriate.	Refer to response to Comment 85.3.
85.202	Analysis Assumptions/ Methodologies	Planning Period	... Massport is presenting information based on five-year-old data and analyzing the results for only a ten-year period in the future.	Refer to responses to Comments 85.3 and 85.40.
85.203	Delay	Model	...analysis was provided for the base year, yet Table 4.5-1 does not indicate the total delay hours for 1993...	The model indicated 135,339 delay hours for 1993 (refer to Figure 4.6-2 and Appendix H in the Draft EIS/EIR).
85.204	Delay	Model	The statement that "1998 delays are less than those experienced in 1993" points up flaws with the forecasting of delay using the methodology and approach presented in the DEIS/DEIR.	The statement referred to FAA reported (Opsnet) delays, which declined from 19,838 in 1993 to 16,403 in 1998. This decline in FAA delays was supported by the Airside Project modeling in the Supplemental DEIS/FEIR which showed a reduction in 1998 delays (120,000 hours) compared to 1993 (185,000 hours). Although total operations were nearly equivalent (519,000 in 1993 and 514,000 in 1998), the fleet mix and demand profile were significantly different. The high delays in 1993 were principally caused by a very peaked schedule with hourly operations exceeding 120 per hour.
85.205	Delay	Model	The document ... indicates that FAA's threshold is to be exceeded by eight times. This comparison is inappropriate since the measures of delay are not the same...	Refer to response to Comment 85.194.
85.206	Delay	Costs	Again, this section of the DEIS/DEIR puts a value on the delay savings that is inappropriate and inaccurate.	Refer to response to Comment 85.197.

Code	Topic 1	Topic 2	Comment	Response
85.207	Delay	Model	... the implementation of Alternative 1 or 1A ... is providing additional capacity ... providing additional "through-put" of aircraft operations.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
85.208	Delay	Model	If as the DEIS/DEIR states, there are delay savings realized by this delay reduction, then there is also a stimulation of air travel demand ...This stimulation is not reflected in the annual hours of delay calculations.	Refer to response to Comment 85.186 & 85.188.
85.209	Analysis Assumptions/ Methodologies	Base Year	Figure 4.5-3, Distribution of Jet Aircraft Operations by Operating Direction, illustrates 1997 actual data. 1997 is not the base year.	The *Logan Airport 1998 Annual Update* included this information which had been developed in late1998. *The Supplemental DEIS/FEIR* provides updated information for the year 1998.
85.210	Noise	Model	... assumes that FAA controllers would select the a) highest capacity configuration, b) meeting of PRAS goals. This assumption has not been historically proved to be true.	Refer to response to Comment 85.181.
85.211	Delay	Model	The section "Revised Wake - Vortex Turbulence Rules" implies that the "new" wake turbulence rules require one aircraft to follow the other at the stated distances. These rules are applicable only to Air Traffic Controllers for providing required spacings between aircraft for following and crossing traffic.	Section 1.5.3.2 of the Airside Project Draft EIS/EIR discusses FAA revisions to IFR radar separations and aircraft weight classifications. These represent the closest separations that can be applied by the controllers under IFR conditions. When visual flight is possible, pilots may visually separate themselves from preceding traffic. Visual separations are typically about 85 percent of IFR separations.
85.212	Delay	Model	Page 4-41 describes 1998 annual delay as 143,000 hours, whereas Page 1-12 describes 1998 annual delay as 128,000 hours. These are modeled hours, a product of "DELAYSIM," not measured hour or "FAA" hours.	Page 1-12 of the Airside Project Draft EIS/EIR clearly states that the 121,000 hours are from DELAYSIM. These are runway-only delays. Page 4-41 of the Airside Project Draft EIS/EIR refers to total modeled delays including runway and taxiway.
85.213	Analysis Assumptions/ Methodologies	Base Year	The use of 1998 data rather than 1993 data strengthens the argument that the "Base Year" must be revised.	Refer to response to Comment 85.3.
85.214	Delay	Model	Questions the validity of the total delay hours calculated by the DELAYSIM model.	The DELAYSIM model represents the most precise model developed to date for measuring delay at Logan Airport.
85.215	Regional Transportation	Regional Airports	No discussion was included concerning development of a new airport to accommodate demand and reduce delays at Logan.	Refer to response to Comment 85.9.
85.216	Alternatives	Other Non-Construction Alternatives	No discussion was included concerning Consideration of Implementing a High-Density Rule (Slots) to control congestion at Logan.	Refer to response to Comment 85.54.
85.217	Noise	Nighttime noise	No discussion was included concerning ...Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions ... A specific measure that could be considered is a cap on nighttime operations.	Refer to response to Comment 85.26.

Code	Topic 1	Topic 2	Comment	Response
85.218	Regional Transportation	Regional Airports	No discussion was included concerning Diversion of general aviation traffic and origin/destination traffic of both regional non-jet and short-haul jet traffic to Massport's Hanscom Field.	Section 2.6 of the Supplemental DEIS/FEIR includes a discussion of Hanscom Field's role in the regional transportation system. General aviation traffic forms a very small percentage of Logan Airport operations (less than five percent) and is not a significant factor in the accumulation of delay. Hanscom Field is a designated reliever airport for Logan Airport and Massport maintains it to encourage use by general aviation. Consistent with Hanscom Field's 1974 Master Plan and the Hanscom GEIR, Massport recently approved the commencement of regional non-jet service at Hanscom Field. Also refer to Comment 85.8.
85.219	Regional Transportation	Regional Airports	[Believe Hanscom has potential to absorb O&D]	Refer to response to Comment 85.8.
85.220	Regional Transportation	Regional Airports	Does not the very conclusion of the Second Major Airport study point out that long-term considerations to meet increasing demand require that a second airport ... be an alternative to the improvements recommended?	Refer to response to Comment 85.9.
85.221	Regional Transportation	Regional Airports	... the development of another air carrier airport has not been reasonably discussed nor have the reasons for its elimination as an option.	Refer to response to Comment 85.9.
85.222	Regional Transportation	Regional Airports	The fact that Massport does not provide long-term planning forecasts ... teamed with its inability to provide as an option the development of a second airport highlights the short-sightedness of the long-term development. ... In the case of many of the close-in neighborhoods, the option for a second airport is reasonable to minimize adverse impacts on their quality of life.	Refer to responses to Comments 85.9 and 85.40.
85.223	Regional Transportation	Diversions	Questions why diversion of passengers to regional airport use, rail use and video and online conference use are indicated to be the same at a 45M forecast level and a 37.5M forecast level.	The estimated passenger diversion of up to 7.3 million includes 3.4 million to regional airports, 2.4 million to telecommunications, 1.2 million to Boston-New York high speed rail service, and 0.3 million to other regional rail projects. The regional airport diversion estimates are averages of the diversion estimates for the 37.5M and 45M passenger demand scenarios. The averages were presented in the Airside Project Draft EIS/EIR document for simplicity of presentation. The rail estimates are from existing, independent rail planning documents that examined total inter-city travel demand regardless of mode of travel and then predicted mode shifts that would result from implementing the rail project. Hence the rail estimates do not differ for the 37.5M and 45M Logan Airport passenger scenarios.
85.224	Regional Transportation	Regional Airports	... the estimated service area of the alternate airports remains the same in 2010 as it is in 1994. This is not an accurate assumption ... Massport fails to list Hanscom Airport as a potential diversion airport.	The regional airport diversion analysis presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR was based on objective service area assumptions. Each service area was defined solely by driving time criteria. In other words, each regional airport's service area consists of cities and towns for which it is the closest airport, regardless of the availability of more services and/or lower airfares at more distant, but larger airports such as Logan Airport. In reality, passengers do drive to larger, but less convenient airports because they offer greater service choices or better airfares than the local regional airport. Thus, the area from which a regional airport draws traffic is often limited by the existence of nearby, larger airports. These limitations were not considered in the regional airport, service area, assumptions that underlie the regional airport diversion analysis.
85.225	Regional Transportation	Regional Airports	Massport fails to list Hanscom Airport as a potential diversion airport.	Refer to response to Comment 85.8.

Code	Topic 1	Topic 2	Comment	Response
85.226	Regional Transportation	Regional Airports	This is a regional problem demanding of regional solutions. ... The Airside Improvement Project must be viewed in this larger regional context.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
85.227	Alternatives	Peak Period Pricing	Questions assumption to have peak hour pricing be revenue neutral and pertain only to Airfield revenue and costs at Logan.	Refer to response to Comment 85.62. Guidance with respect to a PPP program and its cost-based structure is set in U.S. DOT's decision in the PACE procedure.
85.228	Alternatives	Peak Period Pricing	Massport's previous experience with regulatory challenges in implementing a demand management technique has affected the assumptions of the model developed.	It would not be prudent to ignore prior experience in developing an illustrative pricing structure for consideration. Refer also to response to Comment 85.62.
85.229	Alternatives	Peak Period Pricing	Suggest a different approach to efficiency, away from the number of aircraft operations in specific periods to maximizing throughput of passengers.	Refer to response to Comment 85.63.
85.230	Alternatives	Peak Period Pricing	Massport's model for peak hour pricing has chosen too narrow a definition of the regulatory criteria it must meet to establish a peak hour pricing structure.	Massport disagrees. Refer to responses to Comments 85.62 and 85.228.
85.231	Alternatives	Peak Period Pricing	[Massport's model for peak hour pricing] also has chosen a higher operational threshold (115 operations) which underestimates the delay reduction capabilities of peak hour pricing.	This statement is incorrect. The PPP analysis was conservatively based on an assumed threshold of 110 operations per hour. Given Logan Airport's normal operating capacity of 120 operations per hour, a higher threshold, like 115 operations per hour, may be appropriate, if PPP is implemented.
85.232	Analysis Assumptions/ Methodologies	Fleet Mix	Massport chose varying data information, both 1993 and 1995 flight schedules for modeling peak hour pricing simulations. Massport has again chosen the input of information which will provide the output it expects.	1993 and 1995 were chosen as representative of historic high and low fleet operating conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR. 1993, the peak year for regional carrier activity at Logan Airport when three large regional airlines were competing actively, is representative of a 37.5 High Fleet scenario. Conversely, 1995, which reflects the failure of Precision Airlines and only two major regional carriers serving the Boston market, is representative of Low Fleet operating conditions.
85.233	Alternatives	Peak Period Pricing	The option of utilizing "costing" (including peak period pricing) approaches for the purpose of delay reduction should be retained.	Refer to response to Comment 85.66.
85.234	Regional Transportation	Diversion	A shift away from air travel through reliance on other means of travel or communication is essential. Vigorous measures to foster and encourage this shift should be undertaken by State government in cooperation with Amtrak and telecommunications providers.	Refer to response to Comment 85.67.
85.235	Alternatives	Preferred Alternative	No indication of how the project is to be financed is provided ...	Refer to response to Comment 85.70.
85.236	Environmental Review Process	FAA/NEPA	Table 8.8-1 does not include the benefit-cost analysis as part of the anticipated permits and approvals required by the FAA.	Refer to response to Comment 85.68.

Code	Topic 1	Topic 2	Comment	Response
85.237	Environmental Review Process	FAA/NEPA	... there is no economic analysis of the noise impacts regarding the various alternatives.	Refer to response to Comment 85.69.
85.238	Alternatives	Runway 14/32	The discussion of this (Option C) as a feasible option did not include a discussion of aborted takeoffs in the 14 direction, and whether the reduced safety overrun would be approvable under that scenario.	Runway 14 is not expected to be used for departures, and these departures would be over water and mostly by smaller aircraft which do not require as large a Runway Safety Area (RSA). For ARC B-III aircraft, the RSA is only 600 feet by 300 feet compared to the 1,000 foot by 500 foot RSA shown in Figure 3.2-4 of the Supplemental DEIS/FEIR. Option C includes a layout design in accordance with FAA standards that provide for safe takeoffs.
85.239	Alternatives	Runway 14/32	Differentiate between cross wind of 20 knots and cross wind component of 20 knots.	A direct crosswind of 20 knots would equate to a wind direction that is perpendicular (90 degrees) to the runway direction. A crosswind component is the calculated equivalent impact of winds that are at an angle of less than 90 degrees to the runway. The wind rule referenced on Page 3 through 7 of the Airside Project Draft EIS/EIR refers to crosswind and tailwind components of the wind vector.
85.240	Alternatives	Taxiway Improvements	The summary of advantages cited for the Centerfield Taxiway (page 3-29) supports the community concern that the presence of the Centerfield Taxiway will make the use of the 4/22 runway combinations more attractive and ... it would increase the tendency to stack aircraft in the northern section of the airfield.	Refer to response to Comment 85.74.
85.241	Alternatives	Runway 14/32	The preferred alternative recommendation does not state which runway option is being recommended. If ... Option C is the preferred layout. ... then it is critical to note that this option would require a modification to standard from the FAA regarding the runway safety area.	Refer to Section 8.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32 and that Option C requires a determination of an acceptable level of safety.
85.242	Alternatives	Runway 14/32	The discussion of Option C does not evaluate the potential of declared distances or displaced thresholds in lieu of requesting a modification to standard.	Declared distances may be used when standard runway safety areas cannot be provided. Massport's Option C provides a full 1,000-foot safety area at both ends of the runway on centerline with only a small percentage of the runway safety area on Runway 32 over water. This option, plus the planned addition of visual aids for pilots (*e.g.*, PAPI/REIL), will provide a reasonable and practicable level of safety.
85.243	Analysis Assumptions/ Methodologies	Fleet Mix	The aircraft mix projected to use Runway 14/32 that was used in the noise analyses should be stated, and justified.	Unidirectional Runway 14/32 would be principally used by regional non-jets and small jet aircraft capable of landing or taking off in 5,000 feet. Appendix E of the Supplemental DEIS/FEIR contains the fleet mix and runway use percentages for each scenario. Sections 6.2.1 and 6.2.5 of the Supplemental DEIS/FEIR present summaries of the INM inputs used for the in-flight noise analysis.
85.244	Analysis Assumptions/ Methodologies	Fleet Mix	The justification on Page 3-24, that only regional and commuter aircraft will use the runway is not consistent with the Airport Design Category (ARC) selected for the Runway which is C-III. C-III aircraft include the following: * Airbus A-320-1000 * BAC 111-200, -300, -400 & -475 * Boeing 727-100, & -200 * Boeing 737-100, -200, -300, -400 & -500 * Fokker F-28-3000 & -4000 * MDC DC-9-10, -15, -20, -30, -40 & -50 * MDC DC-9-80 & -82	Design Category C-III indicates the highest approach speed and widest wingspan of the aircraft intended to use the runway. Approach Category C includes a number of business jets as well as the Saab 2000 and Avro RJ100 commuter jets. Design Group III includes a host of commuter aircraft such as ATR, Avro RJ, ATP, Dash7, Dash8, Fokker 50/60, and Saab 200. Although larger jets fall into the C-III as noted in the comment, their required runway takeoff and landing distances would prevent most of these aircraft from using Runway 14/32. For operating efficiency, FAA controllers would keep the large jets on Runway 33L and the smaller aircraft on Runway 32.

Code	Topic 1	Topic 2	Comment	Response
85.245	Alternatives	Runway 14/32	It appears that Massport is presenting the proposed runway as a non-precision runway used only by commuter aircraft. However, it is obvious that long-range plans include precision instrument capabilities and operations by a variety of large jet aircraft.	A precision runway is one that provides electronic landing guidance in the vertical dimension, which can benefit all types of aircraft operations, not just commercial jets. Runway 32 has always been intended for precision approach guidance, probably using the new GPS navigation capability. Landing instrumentation is no indication of the aircraft that will use a runway. Most large jet aircraft would be unable to use Runway 14/32 because of its length. Refer also to Comment 85.244.
85.246	Alternatives	Runway 14/32	... Massport cannot, as proprietor of the airport, ensure that proposed Runway 14/32 will be unidirectional.	Refer to response to Comment 85.19.
85.247	Alternatives	Runway 14/32	Although Massport states that Runway 14/32 will be built with a non-precision approach, their discussion shows that there may be the possibility of making this a precision approach...with construction of a light pier (for Runway 32] similar to that on Runway 33L. ... the runway combinations of arrivals on Runways 33L and 32, with departures on Runway 27, would become the highest capacity combination under IFR conditions.	The primary benefit of Runway 14/32 is to reduce delays during VFR conditions when strong northwesterly winds current limit Logan Airport to a single arrival stream. During IFR conditions, landings on Runway 32 would be limited by obstacle clearance—ship masts in the harbor and buildings in Boston. No approach lighting pier is planned for Runway 32 since it could not improve the landing minimums below 400 to 500 feet. Moreover, under IFR conditions the capacity of the Runway 33L/32/27 configuration would be compromised by the need for diverging missed approach and departure paths and the crossing of both Runway 32 and Runway 33L by Runway 27 departures.
85.248	Delay	Model	The delay hours projected by Massport are the artifacts of its own model, and do not comport with the FAA's procedure for calculating delays at airports. In addition to calculating every minute of delay associated with every single flight, it fails to take into account normal flight cancellation activities by airlines. Additionally, FAA calculation and tabulation of delays at Logan over the last five years shows little change either year to year or as a trend.	Refer to response to Comments 85.46, 85.195, and 85.196.
85.249	Alternatives	Peak Period Pricing	...peak period pricing must be instituted immediately.	Refer to response to Comment 85.66.
85.250	Alternatives	Runway 14/32	"Modification of standards" for Layout Option C should be thoroughly explored.	A Determination of Acceptable Level of Safety, not a Modification of Standards, is required from FAA for Option C.
85.251	Air Quality	Impacts	... believe there are adverse air quality impacts associated with construction of Runway 14/32 and the Centerfield Taxiway.	The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.
85.252	Noise	Sound Insulation	Residential "sound-proofing" does not fully mitigate the impacts... from implementation of Alternative 1 or Alternative 1A...	While sound insulation does not mitigate exterior sound levels, it is a widely accepted measure considered appropriate for general mitigation of noise impacts. Sound insulation reduces noise inside the home. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative. Measures designed to improve PRAS (i.e., the PRAS monitoring program) are also mitigation measures. Improved achievement of PRAS goals under the Preferred Alternative will further benefit the most highly exposed areas around Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
85.253	Noise	Impacts	The reduction in ground noise impacts claimed for Alternative 1 or Alternative 1A...is likely to be short-lived...	The ground noise analyses in Section 6.2.4 of the Airside Project Draft EIS/EIR lead to the opposite conclusion. For example, Table 6.2-21 of the Airside Project Draft EIS/EIR indicates that, at all seven sites examined, the reduction in exposure is greater under both the longer-term 37.5M High Fleet and 29M Low Fleet scenarios than it is under the near-term 29M Low Fleet scenario. Recent growth trends suggest the 37.5 million passenger level is now more likely to occur around 2015. (Refer to related discussion in Section 1.4.2 of the Supplemental DEIS/FEIR).
85.254	Ecosystems	Rare Species	... creation of a replacement habitat on Cape Cod [for the upland sandpiper] appears to ignore geography and is of questionable benefit.	Refer to response to Comment 85.78.
85.255	Alternatives	Peak Period Pricing	...disagree with the recommendation to defer implementation of peak period pricing.	Refer to response to Comment 85.66.
85.256	Alternatives	Runway 14/32	The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible.	Refer to response to Comment 85.19.
85.257	General Opposition		... this project sends [the signal] that Massport continues to be committed to expansion of Logan Airport, ... concerns ... the surrounding communities.	Refer to response to Comment 85.80.
85.258	Analysis Assumptions/ Methodologies	Planning Period	The selection of the preferred alternative responds solely to the current conditions and points out Massport's continued blindness to the long-term demand and capacity issues.	Refer to response to Comment 85.82.
85.259	Alternatives	Preferred Alternative	Alternate No. 2 and Alternate No. 3 appear to be the most viable for the community.	Refer to response to Comment 85.81.
85.260	Environmental Review Process	FAA/NEPA	The DEIS/DEIR discusses the preferred alternatives effect on historic districts but does not comment on the urban quality, or the design of the built environment.	The proposed projects evaluated under each of the alternatives are located on the existing airfield. Implementation of any of the proposed projects will not physically change the urban characteristics or the design of the built environment within adjacent communities when compared to the No-Action Alternative. Off-airport noise impacts from the Preferred Alternative are discussed in Section 6.2 of the Supplemental DEIS/FEIR.
85.261	Environmental Justice	Impacts	The external costs ... that the preferred alternative would impose on the Logan communities are substantial. These costs have not been adequately assessed ...	Refer to response to Comment 85.68.
85.262	Open Space/ Parkland	Impacts	Noise impacts on historic sites ... was not adequately evaluated ...	The FAA and Massport have consulted with the Massachusetts Historical Commission (MHC). The MHC has concurred with the FAA's determination that the Preferred Alternative will have no adverse effect on significant historic properties. Refer to Section 6.3.2 of the Supplemental DEIS/FEIR for a description of historic properties, project impacts and mitigation.

LETTER 86

---

18 Greenough Avenue
Jamaica Plain
Boston, MA 02130

April 20, 1999

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Unit
Arthur Pugsley, EOEA No. 10458
1000 Cambridge Street - 20th floor
Boston, MA 02202

Dear Secretary Durand,

am writing to comment on the Massachusetts Port uthority's (MPA) Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/R) EOEA #10458.

The DEIS/R does not make a credible case for building the proposed Runway 14/32 in order to solve operational delays at Logan International Airport. Its conclusions are based on out-dated data and a system for projecting delays which is neither approved nor accepted on a national level by the FAA. The chosen system produces large numbers of hourly delays contrary to FAA and DOT figures which show quite the opposite.

The DEIS/R does not adequately addresss either the socio-economic impacts or the significant environmental impacts from the proposed project to inner city metropolitan Boston communities. At the same time, it simply dismisses the environmental justice issue by proffering the mitigation of sound insulation. The report, however, fails to consider FAA Order 5100.38A in this regard. Order 5100.38A makes any structure not up to current local building de ineligible to receive AIP funds. Since the cost

86.1

86.2

born by the owner, and since most residences newly impacted by this project's noise are in low-income and minority neighborhoods, it is safe to assume that such costs would be a hardship and possibly unlikely to occur. Therefore, there would be no mitigation, and the lack thereof would be explicitly due to economic hardship.

The computer noise model (INM) used in the EIS projects a tripling of noise over most of South Boston, the South End, Roxbury, Jamaica Plain, East Boston, Charlestown and most of Chelsea. Incredibly, such an increase is not deemed to be a "significant" environmental noise impact. Furthermore, there is no discussion in the DEIS/R about how MPA could "avoid or minimize" these impacts or how MPA can "enhance the quality of the human environment" in these close-in, densely populated, low-income and minority communities. (CEQ sec.1502.1) 86.3

As you know, Regulation 301 CMR 11.01 states that MEPA must "assist each Agency in using all feasible means to avoid Damage to the Environment." Your agency cannot do so if "all feasible means" have not been analyzed. MPA has left out of its analysis any benefits derived from increasing the use of MPA's Hanscom Field or the construction of a second major airport. 86.4

As a member of the Community Advisory Committee to MPA(CAC), I did not receive a Notice of Project Change (301 CMR 11.10 [7]). It is not in the DEIS/R. My understanding is that those who received the ENF and commented on the ENF should have received the Notice. I ask that the Notice of Project Change be denied. The Notice for Lapse of Time between the publication of the ENF and the publication of the notice of the availability of the EIS/R should have been filed in August of 1998. I believe that the lapse of time was a conscious choice of MPA affecting the environmental impact conclusions in the DEIS/R through the use of out-dated data from 1993, MPA's 'base case', as well as the use of ten year old (1981-90) weather data. These important factors, upon which MPA's conclusions are drawn, are inappropriate and unacceptable. 86.5

From April 1997 through January 1999, MPA discontinued EIS/R Airside Review Committee (ARC) meetings, giving no reason other than that the project was "on hold." After a self-imposed delay of twenty months, MPA then chose not to redo the analysis with more current relevant data, but to continue using data that was, by then, between seven and seventeen years old. For that reason also, I urge that the Notice be denied and the study returned to MPA to be redone with more current data and a more complete range of alternatives.

The DEIS/R should be a full disclosure document and it is not. Noise contour maps are illegible, making the identification of exactly which communities will be impacted by which contour (DEIS/R pages 6-24 through 6-30) impossible. The reliance on the GEIR as filler for the DEIS/R is unacceptable. The 1997 GEIR is a broad scale analysis of all proposed MPA projects. Neither document adequately addresses the cumulative impacts of ground transportation environmental pollutants along with the airside pollutants. Common sense dictates that an increase of over 20 million passengers using Logan Airport within the next ten years will most certainly have an effect on ground traffic throughout metropolitan Boston. I find it outrageous, then, that MPA can state, "The Airside Project will have no effect on vehicle traffic, transit systems or major roadway intersections." " It will have no affect on VOC or NOx emissions from motor vehicles"(DEIS/R Volume II, Letter 1, Code response 1.15 & 1.16). This EIS/R and the GEIR have no detailed ground traffic study for long-term environmental impacts. 86.6

This EIS/R is a capacity-enhancing project, with large numbers of people being significantly impacted by noise, traffic and air pollution while existing environmental impacts have yet to be adequately mitigated.

I respectfully ask that the DEIS/R be found inadequate by the Secretary of Environmental Affairs for the reasons stated above, as well as for those reasons submitted by the CAC and Attorney Peter Koff. I ask that you join the CAC and Communities Against Runway Expansion (CARE) in requesting that MPA and the FAA withdraw the project from further public consideration or processing until development of a true Regional Transportation Planning Forum can evaluate regional needs and all alternatives to the Runway 14/32 proposal. 86.7

Sincerely,

Anastasia Lyman

Letter 86

Code	Topic 1	Topic 2	Comment	Response
86.1	Environmental Justice	Impacts	...does not adequately address either the socio-economic impacts or the significant environmental impacts...to inner city metropolitan Boston communities.	Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8.6 of the Supplemental DEIS/FEIR for additional information.
86.2	Noise	Sound Insulation	Concerned about sound proofing eligibility on low income homeowners with existing code violations.	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport-sponsored sound insulation program. However, to address impacts in particular projects such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of this mitigation program to the extent such improvements are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes.
86.3	Noise	Impacts	The computer noise model (INM) used in the EIS projects a tripling of noise over most of South Boston, the South End, Roxbury, Jamaica Plain, East Boston, Charlestown and most of Chelsea. Incredibly, such an increase is not deemed to be a "significant" environmental noise impact.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities.

Code	Topic 1	Topic 2	Comment	Response
86.4	Regional Transportation	Regional Airports	MPA has left out of its analysis any benefits derived from increasing the use of MPA's Hanscom Field or the construction of a second major airport.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. A second major airport is not a solution to the current delay and congestion problems at Logan Airport.
86.5	Environmental Review Process	MEPA	I did not receive a Notice of Project Change [301 CMR 11.10(7)]. I ask that the Notice of Project Change be denied.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
86.6	Noise	Studies	Noise contour maps are illegible, making the identification of exactly which communities will be impacted by which contour (DEIS/R pages 6-24 through 6-30) impossible. . The reliance on the GEIR as filler for the DEIS/R is unacceptable.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
86.7	Environmental Review Process	MEPA	I respectfully ask that the DEIS/R be found inadequate....	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Dear Mr. Pugsley,

I am writing you today to express my support for the findings of the CAC consultants with regard to the Logan Airside Improvements Project EOEA #10458. I find the document to be lacking in many areas.

The delay problem will continue to grow regardless if there is a new runway because of the projected growth of passengers. Flight delays due to this projected growth will not be the only result from this growth but there will be catastrophic ground vehicular delays because the current road infastructure will not be able to accomodate these passengers. This should be a clear signal that instead of expanding at Logan there needs to be a more sound and rational approach and my belief is that approach is a multi-faceted reliever airport system (a regional solution). 87.1

This system would in fact not only take care of the projected growth but must also downsize Logan itself. For far too long, Logan has been growing and it is the surrounding communities that are suffering the pains of that growth. Environmental justice dictates that the time has come to halt any further expansion and to roll back some of the growth that has gone on unchecked for many years. 87.2

Massport & the FAA have created flawed metrics with regard to: the number of delay hours; Peak Period Pricing scheme; PRAS Goal attainment; Soundproofing mitigation; and regional airport system.

Never it is it mentioned that the base year of 1993, as regards delay, that it was a record year for snowfall, setting a record with 96" of snow. Not your typical weather-year. 87.3

Peak Period Pricing, as presented, is certainly only ~~one~~ one scheme that could be devised. Before spending $25M it would be worth a look at other schemes that could help reduce delay during peak periods. 87.4

PRAS is an advisory system of suggestions to the FAA Air Traffic Controllers who have been loath to avail themselves of its suggestions, historically. 87.5

Sound Proofing for homes is dubious mitigation at best. The 65 db LDN requirement is too low a threshold. Sound Proofing will not work if you must have your windows open, such as in the warm weather and of course it does nothing for your outdoor environment. People can not be expected to be kept bottled up in their soundproof home. 87.6

Regionalization of air transportation system makes good sense. If Logan drew its passenger base only from within the Rt 128 area that would certainly be a considerable number of people, however Logan in fact draws from a much greater area and therein lies a major fault. Logan in NOT centrally located to this great area but is in fact on one far edge of this area. The problems increase when all these people coming to Logan are squeezed together much like as in a funnel or venturi. The very movement, in whatever means, of these people toward Logan creates stresses on the environment. Pollution breeds health problems. If some ~~cobay~~ ~~cas~~ ~~cobay~~ catastrophe should happen to the funnelling infrastructure that brings people to Logan then those very people are going to experience more than a delay problem, they may even miss the flight. If on the other hand a major catastrophe should happen at Logan then the whole region suffers. It is eminently more sound to have multiple airport facilities. The logistics makes better sense. The better quality of life and environment make better sense. It is the American way to have more competitive alternatives to choose from.

87.7

In closing I would relate that although I do experience jet departure noise at 90 DB or greater when a particular runway is in use I am not now or projected to be within the 65DB LDN Contour. Remember the ads for home burglar alarms are assuring purchasers that their 85DB alarm will drive the burglar away. Well sir the noise from jet departure overflights is driving me away; away from my phone conversation; away from enjoying some TV; just away from plain fr enjoyin life.

87.8

87.1	Regional Transportation	Regional Airports	The delay problem will continue to grow regardless if there is a new runway...there needs to be a more sound and rational approach and my belief is that approach is a multi-faceted reliever airport system (a regional solution).	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
87.2	Environmental Justice	Impacts	Environmental justice dictates that the time has come to halt any further expansion....	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.
87.3	Analysis Assumptions/ Methodologies	Base Year	Never is it mentioned that the base year of 1993, as regards delay, that it was a record year for snowfall....	Delays are a function of wind and weather conditions throughout the year, as well as the corresponding traffic demand. For example, overnight snowstorms cause relatively few delays because the demand is low. 1993 was also a record year for airline overscheduling.

Code	Topic 1	Topic 2	Comment	Response
87.4	Alternatives	Other Non-Construction Alternatives	Before spending $25M it would be worth a look at other schemes that could help reduce delay during peak periods.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
87.5	Noise	PRAS	PRAS is an advisory system of suggestions to the FAA Air Traffic Controllers who have been loathe to avail themselves of its suggestion, historically.	During very high demand periods, the controllers have little or no flexibility for runway selection and PRAS recommends an appropriate runway configuration given the extant demand. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals. The Supplemental DEIS/FEIR demonstrates that the controllers have been improving performance with respect to PRAS recommendations. Section 8.5 of the Supplemental DEIS/FEIR contains methods for more comprehensive monitoring of PRAS. These methods will be implemented as part of the mitigation program for the Airside Project.
87.6	Noise	Sound Insulation	Sound proofing for homes is dubious mitigation at best. The 65db LDN requirement is too low a threshold...People cannot be expected to be kept bottled up in their soundproof home.	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update.* Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
87.7	Regional Transportation	Regional Airports	Regionalization of air transportation system makes good sense...It is eminently more sound to have multiple airport facilities.	The proposed Logan Airport Airside Project is necessary and provide clear benefits at current traffic levels. Massport has long recognized that service development and increased passenger traffic at the regional airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, especially high-speed rail to Logan Airport's largest market, New York. Section 2.3 of the Supplemental DEIS/FEIR evaluates T.F. Green/Providence, Manchester, and Worcester Regional airports and their potential impacts on Logan Airport. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport but will not eliminate the need for airside projects.
87.8	Noise	Impacts	...although I do experience jet departure noise at 90 DB or greater...I am not now or projected to be within the 65 DB LDN contour.	Even though maximum sound levels may reach 90 dBA at a specific location, they may not be frequent enough to cause the DNL to go above 65 dB. The whole principle behind DNL is that it is a *cumulative* measure of noise exposure that is influenced not only by the loudness of events but also by how often they occur. It is not inconsistent for a site to experience sound levels of 90 dBA but have 24-hour exposure levels less than 65 dB. See Appendix E for an additional explanation of noise metrics.

LETTER 88

ROXBURY AIRPLANE POLLUTION COMMITTEE

April 17, 1999

Mr. Robert Durand
Secretary, Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. #10458
100 Cambridge Street 20th Floor
Boston, MA 02202

Sir,

The official rationale behind the Logan expansion project being submitted by Massport is unambiguous: operational delays. Yet, in a recent radio advertisement, a major airline boasted that its shuttle operations from Logan airport had an on-time performance rate of 97%. Another airline has been adding flights to its West Coast destinations from Logan. Their chief competitor is scheduling new nonstop service to Europe while some European carriers have started flights to Boston.

These facts fly in the face of the official rationale for this expansion project. Inevitably, fairness would require Massport to provide an in-depth analysis of the causes and the extent of the delays justifying the erection of a new runway at Logan airport. It seems equally fair to ask whether the invoked delays truly hinder carriers in their current operations or deter them from expanding their already considerable operations at Logan airport. 88.1

The Draft Environmental Impact Statement/Environmental Impact Report is totally silent on the already prohibitive cost borne by populations under the flight paths out of Logan airport. The significant increase in air-traffic resulting from the erection of runway 14/32 will make a very bad situation considerably worse. At times already, 2 jetplanes/minute fly over some communities and for up to 17 consecutive hours. Just as has been done with the relocation of the Sandpiper, the terrible toll exacted by Logan operations on surrounding communities, including the less privileged ones, must be quantified. Roxbury in particular has been unduly hit by unprecedented pollution from airplane activity without any compensation or mitigation. This unbearable burden is slated to reach unreasonable heigths with the new runway. Any expansion at Logan airport will then further degrade the quality of life for residents with no appreciable gain for airline passengers. 88.2

The alternative of routing these passengers through relief airports or other transportation means demands more than the cursory treatment in the Draft EIS/EIR.

Indeed, there may lie some of the best options to accommodate additional travelers to the Boston area, Massachusetts and New England.

We respectfully urge you to reject the current proposal from Massport and require the agency to undertake a comprehensive assessment of all available options to adequately accommodate the needs of passengers in the immediate as well as the more distant future. 88.3

Like San Francisco, Denver, Hong Kong, Paris, Munich, Montreal, New York, Washington D.C. and other world-class cities, Boston and its visitors deserve a multiple-airport system residents can live with. An inadequate proposal of the 1970's is an unlikely answer to the challenges of air-traffic growth in the 21st century.

Respectfully yours,

Dovi Abbey

Code	Topic 1	Topic 2	Comment	Response
88.1	Purpose and Need	Delay	...fairness would require Massport to provide an in-depth analysis of the causes and the extent of the delays justifying the erection of a new runway at Logan Airport.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
88.2	Environmental Justice	Impacts	The terrible toll exacted by Logan operations on surrounding communities, including the less privileged ones, must be quantified. Any expansion at Logan Airport will then further degrade the quality of life for residents with no appreciable gain for airline passengers.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.

Code	Topic 1	Topic 2	Comment	Response
88.3	Regional Transportation	Regional Airports	[Need] to undertake a comprehensive assessment of all available options to adequately accommodate the needs of passengers in the immediate as well as the more distant future.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

RE: Runway 14/32, #10458

Dear Mr. Pugsley:

As a member of the Community Advisory Committee representing Roslindale and Hyde Park, I have enclosed my comments in response to the Environmental Impact Study/Report submitted by Massport relative to Runway 14/32 at Logan International Airport.

It is my hope that your agency will carefully review and incorporate resident concerns regarding the negative public health impact of this proposal on the surrounding communities. There is widespread citizen opposition to this proposal and your analysis relative to the negative environmental impact is vital to set the framework that will allow residents who live in the surrounding communities a more broad based effort in reviewing this ill-conceived proposal.

Thank you for your immediate attention to this issue and please make my comments a part of the official comments regarding Runway 14/32.

Very truly yours,

Alex Geourntas

Community Advisory Committee to Massport

RE: ***Massport's Runway 14/32 Proposal-EIS/EIR Report***

DATE: April 12, 1999

As the Roslindale/Hyde Park representative on the Community Advisory Committee (CAC), I am writing to state my opposition to Runway 14/32 and the Environmental Impact Report/Study as submitted by Massport.

This issue has united many residents of the various communities surrounding Logan Airport. Many residents are strongly opposed to this expansion. I have attended many CAC and community meetings where Massport's presentation suggests that the new runway will have a positive impact on Logan Airport, passengers and for business interests in New England. There is no mention of its negative impact to the surrounding neighborhoods and communities that will see a definitive increase in airplane traffic and noise further compromising the quality of life of these residents.

I am surprised by Massport's refusal to recognize the environmental impact and direct consequences of the new runway upon homeowners in Boston and the North and South Shores of our state. The cumulative effect of airplane noise and exhaust is an environmental concern and the long term effects of this exposure is a public health hazard; not to mention the increased traffic and congestion that will occur in downtown Boston, in particular in East Boston and South Boston. Congestion is a problem now throughout Boston and Runway 14/32 will make a bad situation worse. Massport is no friend to area residents. It continuously ignores the impact the airport is having on the surrounding communities and Massport precludes any mention of the community impact in any of their presentations. 89.1

The building of the new runway will increase capacity at the airport that in turn will increase takeoffs and landings that in turn will increase passenger and cargo capacity, which in turn will increase the "bottom line" for Massport-the only real concern for Massport. The "delay" argument is not pursuasive since Massport Executive Director, Peter Blute admitted to manipulating the numbers to leverage the argument for a new runway. Delay data for the EIS/EIR was utilized from figures that were produced in 1996 when delays were at a high rate; however, the delays between 1996-1999 have seen yearly reductions and the figures in the report are not an adequate representation of the current situation at Logan. 89.2

Public health and the quality of life of residents and their communities must be the priority for city and state governments. Each and every resident has the right to enjoy the quiet surroundings of their environment. The airport is negatively impacting the surrounding communities. Exhaust fumes, noise, congestion and poor air quality are serious environmental and public health issues that must be addressed by the Massachusetts Executive Office of Environmental Affairs. 89.3

Air traffic on Runway 27 will triple with the new configuration of 14/32 thus increasing flights over Roslindale, Hyde Park, Jamaica Plain and West Roxbury. This is unacceptable and this item has not and probably will never be part of Massport's presentation to the communities mentioned above. At a recent community meeting in Jamaica Plain on March 22, 1999, this issue was ignored by Massport. Representatives only repeated their arguments for a new runway. Again, Massport is far more concerned with the "bottom line" than the lives of families in and around Boston. However, they do have a plan of action for the Upland Sandpiper and other wildlife at the airport! 89.4

While I believe there is no need for a new runway at Logan Airport, I also believe that the best solution for capacity and delay concerns at Logan is achievable at Hanscom Air Field. Hanscom is another issue that is not a part of the Massport presentation when mentioning a regional approach to air transportation issues. Worcester, Manchester, and T.F. Green Airports are mentioned as part of this regional approach; however, Hanscom is not mentioned and this truly is a slap in the face to the affected communities around Logan Airport. This airfield is expansive and provides the best solution to Logan's problems today and in the future.

Massport is protecting Hanscom and the surrounding communities by eliminating Hanscom as a viable alternative. Simply put, Massport is employing a "divide and conquer" strategy in Massachusetts. Massport and state government officials have protected these residents for quite some time at the expense of our communities here in Greater Boston. They have not fairly shared the burden with their fellow citizens in and around Boston. This situation is indeed reprehensible and unjustified. 89.5

Many current airport operations can be relocated to Hanscom with Massport increasing its capacity at Logan and thus reducing delays as well. General aviation aircraft, cargo operations and shuttle services to New York, I believe, can be shifted to Hanscom. Passengers who utilize the shuttle services are predominantly from communities in the 128/495 area of our state. The burden can and must be shared by all in Massachusetts not by a few as is the case now. If Massport fails to expand Hanscom Field operations, Logan Airport will be at the same juncture as we are today in 5 years or less with increased delays, congestion, noise and pollution.

Massport's arrogance is certainly well known in the Boston area and we have had enough. The time has come for Massport to finally recognize that all its research, money and influence will never stifle the opposition on this issue. Massport continues its strategy of manipulation employing an air of superiority. Opposition members remember the long, hard fight of the 1970's and most are experienced veterans who are just as committed to opposing this ill-conceived proposal. They are willing to continue the struggle for fairness and for their rights to live in a safe, healthy and peaceful environment.

I certainly hope my comments will create doubt about this flawed project and MEPA will do the right thing and support the residents' position and opposition to Runway 14/32. Rejecting the EIS/EIR will validate the concerns of area residents and force Massport to deal on a level playing field for a change. Boston and surrounding communities will not take a back seat and ignore the injustices perpetrated by Massport.

I strongly oppose this proposal and it is my hope that the concerns of so many residents of our Commonwealth resonates with MEPA staff and I urge your department to reject Massport's Environmental Impact Report and Study. 89.6

Thank you.

Letter 89
Community Advisory Committee Representative, Roslindale/Hyde Park Alex Geourntas

Code	Topic 1	Topic 2	Comment	Response
89.1	Noise	Impacts	The cumulative effect of airplane noise and exhaust is an environmental concern... Massport...continuously ignores the impact the airport is having on the surrounding communities....	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
89.2	Delay	Model	The "delay" argument is not pursuasive [sic]...the figures in the report are not an adequate representation of the current situation at Logan.	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate *and long-term* benefits by lowering runway delays by 38,000 hours under 1998 conditions, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. The sooner airside efficiencies are implemented, the more benefits will accrue over time.

Code	Topic 1	Topic 2	Comment	Response
89.3	Public Health	Effects	Exhaust fumes, noise, congestion, and poor air quality are serious environmental and public health issues that must be addressed....	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. Consistent with the request made by EOEA in its Certificate, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach the 1999 passenger forecast (29 million) presented in the Airside Project Draft EIS/EIR until 2002 or 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts will not be achieved until after 2020. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
89.4	Noise	Runway Use	Air traffic on Runway 27 will triple with the new configuration...This is unacceptable....	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
89.5	Regional Transportation	Regional Airports	Massport is protecting Hanscom and the surrounding communities by eliminating Hanscom as a viable alternative.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
89.6	Environmental Review Process	MEPA	...I urge your department to reject Massport's Environmental Impact Report and Study.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

LETTER 90

Dear Mr. Pugsley:

Re: Logan Airside Improvements Planning Project
Massport Environmental Impact Report
Case No. 11895

As the Town of Braintree's Representative to the Community Advisory Committee to Massport (CAC), I hereby register my support of Review Comments re the above-entitled project as prepared by the CAC Consultants, Robert G. Burns, Monty Gettys, Montgomery Consulting Group, Inc. and David Standley, P.E.

Because Massport has failed to provide a long-term plan and has chosen instead to settle for a short-sighted one that will adversely affect those of us who live under the flight paths, I, as the Town of Braintree's Representative to the CAC, hereby vehemently oppose the Logan 2000 Project in general and the construction of the proposed new runway 14/32 in particular.

Therefore, I urge MEPA to reject Massport's Environmental Impact Report and require said agency to redo the EIS/EIR, as I believe that data contained therein is flawed and unreliable. 90.1

Respectfully submitted,

Sandra M. Kunz
Braintree Representative to Community Advisory Committee to Massport

April 21, 1999
Robert A. Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge St. Room 2000
Boston MA 02202

Re: Runway 14/32 Logan Airport - EOEA 10458

Dear Secretary Durand:

Enclosed find a copy of the comments I made at the FAA/MEPA hearings of April 7, 1999. I hope that the arguments and reasoning advanced will convince you to declare Massport's current draft EIS an inadequate one.

In brief, their data are old; they used their own rather than the FAA's formula to model delays. They have data from 1998, why don't they use it?

91.1

They did not differentiate among the types of delays, delays being the basis of their support for the runway. They lumped all delays together. They did not separate out those delays in which the entire airport was shut down due to snow or fog [six extra runways will not help in those circumstances].

They did not indicate which airlines were most delayed. The national list, just published yesterday, identified which airline companies are most delayed due to their own internal organizational deficiencies. Many of the most delayed airlines are the ones who do the most business out of Logan - United, American, US Air. The least delayed airline, Southwest, is the main carrier at TF Greene and does not run out of Logan.

They did not indicate how many delays are incurred by Logan passengers who twiddle thumbs on the ground because of Massport's managerially inept systems for baggage handling as well as chronically back dated, or entirely missing, departure and arrivals screens, or unreadable or useless wayfinding signs. I defy all passengers to find the one Northwest Airlines gate at Logan unless they know where it is ahead of

ahead of time, in the far corner of the international terminal, with no sign and no reception area. Do we blame that kind of ill planning on lack of a runway too? Massport does not have its act together as an agency. Period.

Massport dismissed all consideration of other alternatives in less than a few pages; they made no sincere effort to find a real solution to the overall problem. That problem is much greater than Logan's needing another runway. Logan Airport is too small now and certainly too small for the future. They chose to completely ignore that reality. 91.2

I hope that you will find my comments helpful, not so much because they have answered all the questions that need to be addressed, but that they have spoken to the many, many more questions which need to be raised and satisfactorily answered.

Thank you for your consideration in these matters.

Sincerely,

Bernice C. Mader

Community Advisory Committee to Massport

Re: Massport EIR Logan Expansion/Logan 2000

OVERVIEW

I address you here as the Quincy Representative to the Community Advisory Committee as well as the President of Citizens Against Airport Noise and immediate past chair of the CAC, for nineteen years.

During this project, Massport has violated both the spirit and the regulations of the EPA, MEPA, and the FAA as well as the sense of fair play and environmental justice. The NEPA/MEPA process, when used wisely and honestly, can be a helpful learning and planning tool for diverse groups of opinion makers to reach consensus but not the way that Massport has tried to manipulate its use. 91.3

As I will later recount, Massport has used both outdated and worst case scenario data as their base case and they have employed highly irregular data-gathering methodologies. Massport's EIR generates very little new knowledge, nor does it advance forward-thinking, thoughtful public policy. 91.4

Massport never examines Logan Airport itself as it now exists. They talk extensively about delays but they never mention the real problem at the airport - its size. A newly created international airport based on only minimally acceptable federal standards would contain at least 5,000 acres and many have 10,000 acres or more. In contrast, Logan Airport consists of 2,400 acres. That is only 48% of the minimum physical size of any new airport created today. 91.5

No major physical improvements had been made to Logan from 1977 until this past year when the new parking garage opened. To allow Logan International Airport to be able to continue to operate, Massport has stretched every airport parameter to its limit and beyond. Logan Airport is too small now and certainly too small for the twenty-second century. No 5,000 foot, uni-directional commuter runway can address Logan Airport's overwhelming shortcomings. It has no more room to grow.

Parking, ground access, pedestrian access, off site park and flys, off site cargo terminals, re-located fuel lines and outrageously difficult wayfinding and signage systems are now at their extreme limits. This postage stamp-sized major commercial airport is now trying to squeeze in another runway to once more accommodate its basic lack of adequacy. The growth of the commercial passenger industry over the past two decades has outstripped Logan Airport. Logan International Airport, in the site where it is currently located, has run out of space, time and capacity.

A large number of cities both in this nation and across the world observed the trends in aviation growth and planned for them. Massport did not. Airport studies were conducted in 1988, 1990 and 1993, the last led by Bud Snyder at the Mass. Aeronautics Commission. Studies are not plans. Those studies were casually disregarded, and discarded, for a variety of reasons - mostly political. Massport clearly did not formulate a comprehensive Master Plan for Massachusetts' aviation needs of the twenty-second century. Instead, it employed a series of stop-gap measures to patch its inadequate infra-structure systems. Massport continues to try to put twenty pounds of flour into a five pound bag.

As one reads the EIR, it is clear that Massport has not fully answered the requirements of the EIR process. CEQ, sec. 1502.14 is the heart of the process. This is the examination and consideration of alternatives. From the issuance of their initial document in the summer of 1995, Massport has listed individual alternatives and bundles of alternatives, but it was as abundantly clear then as it is now, that Massport had a chosen "favorite" for which it would develop and skew supporting data. The coverage given to the listed alternative choices is complete lipservice, such as Hanscom Field, two and one half short paragraphs; five paragraphs to dismiss video teleconferencing and only three paragraphs to dismiss the north south rail link, the Portland rail link and the northeast corridor improvements combined. Completely absent from all consideration is the other wholly ignored alternative, the development of a new airport. Massport wanted the shoe to fit no matter how they had to cram that foot into the glass slipper. 91.6

Section 1502.14 (a) requires Massport " to rigorously explore and objectively evaluate all reasonable alternatives"; "to present the environmental impacts of the proposal and the alternatives in comparative form"; (b)"to devote substantial treatment to each alternative considered in detail"; (d) "agencies shall include the alternative of no action". In 1502.15, the EIS shall *precisely* describe the environment of the area itself and the area around it that "is to be affected or created by the alternatives under consideration". They "Shall discuss the relationship of the proposed actions to adopted or proposed land use plans, policies, controls, and goals and objectives of affected communities, including communities outside the jurisdiction in which the proposed project is located." 1502.14 says that "it shall include discussions of direct effects and their significance and indirect effects and their significance."

Massport has not adequately responded to these requirements. Instead of sincerely and fully examining these regulatory edicts, Massport and its management, for almost the past two years, has chosen to go out and lobby publicly for its alternative of choice - a new runway 14/32 and a new centerfield taxiway. Their study is inadequate and outdated and incomplete. It needs to be re-done.

Executive Director Blute has made dozens of presentations to the state's Congressional delegation, private companies, a variety of Chambers of Commerce and special interest organizations like Associated Industries of Massachusetts, the High Technology Council, the New England Council and many local civic organizations. These presentations all occurred during the period in which Mr. Blute had publicly assured the joint Logan Airside Review Committee (ARC) that he was "going to look at all of the alternatives and get back to the ARC." Despite Mr. Blute's public pledge in August of 1997 to "neutrally examine all of the alternatives", within a few weeks after that pledge, Mr. Blute was in Washington advocating the runway to the federal Congressional delegation as well as to the East Boston Chamber of Commerce.

The ARC is composed of the Community Advisory Committee to Massport, which consists of citizen representatives from 24 communities formally appointed by their mayors or Boards of Selectmen, along with an equal number of private businesses and airline companies appointed by the Executive Director prior to Peter Blute, Stephen Tocco. The ARC was the formal, recognized Massport-designated team of both sides. Its mission was to listen to, and to question, in each other's presence, Massport's consultant team's data for the EIR.

91.7

Over an 18 month period, when I was still chair of the ARC, and later my successor, Anastasia Lyman, almost monthly calls were placed to Peter Blute and/or his Director of Aviation Planning, Betty Desrosiers, asking them where he was in his analysis. The answer always came back that "he was examining alternatives".

We citizens came to know differently as we learned that Mr. Blute was lobbying various forces for his alternative of choice. He was making favorable presentations of Massport's choice to many local civic groups, by-passing the officially appointed ARC. Mr. Blute preferred to speak to uninitiated citizen and business groups who had neither the background, the history or the information to ask him pointed and probing questions.

During this 18 month, unexplained hiatus from the EIR process, the ARC members received no information from the Massport consultant team. Citizens were told that Massport consultants and the FAA were "gathering data" and "working on things" . We all know that they were not gathering data for had they done so, then this EIR would not be based on six year old information from a worst case scenario base year which used the worst year for delays that Massport has ever had.

When the EIR process suddenly resumed in 1998, just days after the state elections, the ARC members were not made aware of its start up or of any new data the Massport consultant team was developing. We were again circumvented from being part of the formal process. The holidays came and went, and a short week into the new year of

1999, Anastasia Lyman, the current chair, received a call from Massport, after a 20 month suspension of activity, that Massport wanted to schedule one last ARC meeting within a week to "sign off on the final draft".

ARC members were outraged and rightfully so. Some data that had been used in the EIR were now over six years old. Neither citizens, nor their consultant advisors, were due to receive their copy of the Draft until the day before the ARC meeting. The Draft weighs many pounds and measures several inches. Over and over we are told, trust the Massachusetts Port Authority. Would you?

DELAYS

When it began its public relations campaign after the state elections, Massport again based its case for the new Runway 14/32 upon the reduction of delays as being the most significant factor affecting Logan's ability to operate. For not only reasons of lost time but for what Massport said was $313 million dollars in lost revenue, Massport said that it must have a new runway as the only way to address these issues. Let us examine their arguments:

When Massport chose its base year for delays it chose the single worst year for delays that had ever occurred. That base year, 1993, was neither indicative nor typical of a normal year. In 1993, Massport incurred 19, 729 flight delays. Delays have never again approached that level. As it is, less than 4% of all flights at Logan are delayed. 91.8

If one examines the weather for 1993-1994, one would also find an unusual winter weather pattern. There were over ten significant winter snowstorms right after each other in that year. The snowfall of 96.3 inches [data obtained from U.S. Weather Service Information Bureau] set a record. The snow did not melt until mid-May.

In its delay section, Massport does not clearly delineate which portions of the delays caused by "wind and weather" were specifically attributable to snow, ice or other severe weather conditions which would have caused delays, such as the closure of runways or the airport itself, regardless of the existence of the number of runways.

When it evaluated the delay situation Massport did not use the FAA method of calculation, which counts any flight as being delayed if it is over 15 minutes late. Massport added up every minute of delay, compressed those minutes into hours and then assigned those hours a dollar value. They said that the cost per lost hour to airlines was $1,115 and $27 per plane passenger based upon a 1997 DOT study. The grand total in 1998 of the cost of delays was said to be $313 million dollars. There is no detail as to how those figures for either the planes or the passengers were arrived at except to quote the DOT 91.9

study. What methods were used by DOT and Massport to determine those numbers?

Though Massport has quantified the delays of airline passengers and airlines in terms of U.S. currency, they have imagined the delay impacts for those living on the ground as being only environmental, with no economic effects. That is a mistake.

THE "INTERRUPTION DELAY FACTOR"

If Massport builds Runway 14/32 for use by commuter planes, then we believe that that action creates more slots for the airlines to fill with larger jet operations on the other runways. That will create more rather than less noise at the airport.

Building 14/32 might temporarily reduce runway delays for about 3-5 years but it will also increase what I will call the "interruption delay" factor for those who live under the flights. In fact, my "interruption delay" model demonstrates that an enormously greater amount of money is lost to the business economy by the "interruption delay factor" than Massport's estimated losses to airlines and their passengers ever will. Let me explain.

The "interruption delay factor" represents the costs to businesses and workers who work on the ground under the noise of the flight paths. Their losses can be quantified in the following way:

Last year in 1998, there were 483,000 Logan flight operations, that is take offs and landings. Those operations rumbled over Boston's 19 neighborhoods as well as the other 18 municipalities which also experience direct impacts from Logan's existence. Using 1998 census data from the Commonwealth of Massachusetts, if one totals the number of citizens just referenced, that number is 1,465,800 people living under one or more of Logan's flight paths. If one adds those workers who commute to Boston to the number of Boston residents, the correct figure including those who drive via the S.E. Expressway, Route 93 S , the Mass Turnpike, Route 1, and those who ride the Commuter Rail systems and the various MBTA Rapid Transit lines to Boston to work, that total number approximates on an average work day, 838,000 people living under the noise from Logan's flight paths in the City of Boston alone and 1,675,800 persons living under them across all the affected communities. 91.10

Assume that 62% of those people work, then slightly over one million people toil under the flight path noise on a given day. According to the latest census information, the average annual income in Boston, [which is lower than many of its surrounding neighbors] is $37,740 or $18.14 hour. However, because I want this analysis to be of the most conservative nature, I have arbitrarily chosen the rate of $7 per hour as being the average lowest going rate for an hourly job in Boston.

The next step in the model is to assess how many people on any given day suffer the effects of Logan's noise pollution. Not all of the people who live and work in Boston are affected by airplane noise all of the time. It is not unreasonable to say that one-third of the "working" population of 1,055,750 may be affected by Logan operations at any one time. The given one-third would also not be affected every day but perhaps three days out of every seven on average and not necessarily for 12 or 18 hours a day but perhaps 6 hours.

In summary, that means that one third of a million people live under flight path noise for three + - days per week at about + - six hours per day. If we model the following circumstances, as Massport models so many things including their delay costs, this is what happens:

Suppose that during the six hours of airplane noise per day, that within each hour, there are five interruptions, averaging one minute per interruption. These interruptions might be one minute pauses for inaudibility during telephone conversations, required verbal repetitions of sales orders or merchandise picking orders, intrusions during business or staff meetings or between agents and clients or sales people and customers.

At five minutes per hour times six hours per day, that is 30 minutes of interruption delays per day. If I take that one day and multiply it by the three days of noise, then each worker will have experienced 90 minutes of interruption delays within a given week. If we then examine the total group of affected workers losing productivity, at $7 per hour, the dollar amount represented by those lost productivity hours per week equals $11,085,375 and $576,439,500 per year! That is at the lowest possible hourly rate of the $7. If I actually used the probable closer to real cost per hour figure of $18.14 per hour, then the loss would be $29,883,004 per week or a staggering $1,553,916,156 dollars per year! Massport's $313M quantification of passenger and airport delays represents only 20% of the "delay interruption penalties" incurred by those who work on the ground.

My model has only addressed the money lost. How do I even begin to quantify the hours of lost sleep, inaudible school lessons, interrupted speech, unavailable enjoyment of the environment, not to mention the negative health effects of high blood pressure, stress, hearing loss and low birth weight babies?

THE PREFERENTIAL RUNWAY ASSIGNMENT SYSTEM [PRAS] GOALS

In the early 1980s, the members of the Massport Community Advisory Committee proposed to Massport that there be an effort to distribute the noise from Logan operations more equitably among the affected communities. Citizens worked with

Massport consultants to come up with a workable model. The model took into account these main factors: the seasonal use and dis-use of certain runways, the use of any runway for more than 8 hours in a 24 hour period called "dwell", and the use of any runway for more than 24 hours within a 72 hour period, called "persistence". It also highlighted the use of over-water landings and take offs as a possible relief for suffering communities. The computer model was supposed to alert air traffic controllers in the tower when any runway had been used over 8 hours in one day, 24 hours in three days or had been on any combination of runways for a long period. If wind and weather permitted, the controllers were supposed to change the runway combination creating relief for those who had been enduring noise for days or hours on end.

Initially, for the first 3-4 years, there was some effort by tower personnel to use the system. However, as the demand at Logan for more and more flights continued to grow, tower controllers began to use more and more of the high capacity runway combinations to accommodate the increased numbers of planes and to ignore the recommendations of the PRAS computer model. For the past eight or nine years, the model has been ignored altogether in favor of tower personnel's being able to "get 'em in and get 'em out" of the airport.

Since Massport's professed arguments for the new runway 14/32 are generally weak and without merit, they had to find some ideas to bolster their new runway argument. Massport refuses to admit that 14/32 is simply a bottom line revenue issue allowing them to accept more new business. After almost a decade of ignoring the entire PRAS idea and its operation, Massport chose to resurrect PRAS's long-ignored noise sharing goals and its stated intention of trying to encourage flights to Logan to come via over the water approaches. Since runway 14/32 borders the harbor, Massport chooses to assert that all of its uni-directional commuter flights would enter and leave Logan via the harbor approach. 91.11

What Massport does not say or clearly demonstrate is where those thousands of new commuter operations will turn back over land. With all of the flights purported to be commuter or corporate sized, the airplane turns from the harbor back over land will be not be conducted at high altitudes, many miles away in the harbor. They will instead turn quickly, generating new noise over already noise-enduring communities. The PRAS part of Massport's 14/32 argument provides no relief at all. In fact, the former PRAS experiment never met more than about 26% of its goals - and that was when the number of operations was far less than now.

Massport refuses to guarantee that it will come one iota closer to meeting those 18 year old PRAS goals, which include "noise abatement" , with runway 14/32. It simply creates new opportunities for more noise.

Should Massport plans go forward, then EOEA, MEPA and FAA should impose substantial fines on Massport for not meeting the PRAS guidelines with communities receiving the monies.

A UNI-DIRECTIONAL RUNWAY 14/32

One of the strongest contentions accompanying Massport's argument for the new runway is its assertion that this runway will never be used in any way but uni-directionally, all operations coming in from, and going out over, the water. Massport swears that the other end of the new runway will never be used to launch operations directly over neighborhoods.

On three public occasions, I personally have asked Massport to quantify this promise by agreeing to create a legal instrument which attests to the uni-directional nature of 14/32 and which forbids its use in the other direction in perpetuity. I have also asked that such a legal instrument become part of the Record of Decision of the FAA in the runway matter should it be built. Massport has refused to agree to this. Given previous history, there is no reason whatsoever to believe Massport's assertion of uni-directionalism their latest version "Trust us". Look at the court case right now where they are trying to remove the previously agreed to injunction against building a new runway. 91.12

USE OF GREENE, MANCHESTER, WORCESTER & HANSCOM AS RELIEVER AIRPORTS

Massport says that it has encouraged use of these facilities as a way to ease Logan's woes. In fact, it actually has not. Greene and Manchester airports have grown because of market forces and ease of use. Cheap airfares, such as those offered by Southwest Air, have lured thousands to Greene. Easier traffic and commuting access to Greene and Manchester have appealed to the flying public. Massport has not once ever launched a public relations initiative to guide business to these competitors. In the absence of a comprehensive aviation plan, and in being criticized for the lack of one, Massport has backed into naming Greene and Manchester as relievers because it suits their purpose, not because they really planned to have them act in those functions.

Additionally, Massport decries the lost $313 million in delay costs but at the same time claims that it seriously supports sending thousands of paying customers to Rhode Island or New Hampshire. Massport is a business. Do you believe that it honestly wants to send business elsewhere on a regular basis?

As for Worcester Airport, for 15 years, CAC members have tried to get Massport interested in developing this facility which has major potential. Instead, Massport has treated Worcester like a leper, allowing its annual passenger use to fall from vigorous levels to a mere 39,000. To be blunt, Massport has not cared about Worcester because

it does not own Worcester. Worcester does not contribute to Massport's bottom line. If Massport is serious in its claims about Worcester Airport, then it will acquire Worcester and work with the Massachusetts Highway Department to build a direct connector road from the Massachusetts Turnpike to the airport.

There are those who will respond to that proposal by saying that doing that would take ten years. Under normal regulatory processes, that would probably be so. However, in the public's interest, those processes can be changed and compressed. A perfect example of this is what occurred because of the demands of the Central Artery project. In order to serve the public's interest and to save the taxpayers money, the Commonwealth wished to deposit the dirt from the Central Artery at the former Quincy/Milton landfills for the Quarry Hills Golf Course project. To do so, the entrance ramp off of the Southeast Expressway had be closed and moved so that it could accommodate the hundreds of large 18 wheeled trucks delivering the dirt every day. In a period of six weeks, the old ramp was closed, the new ramp design approved and the new ramp built and opened. Normally this would have been a three year or more process. If state government, working with the FAA, has a will to make Worcester functionally important for commercial aviation, it can do so and do so quickly. The commitment and the money just have to be provided. 91.13

As for Hanscom Field, Massport seems loathe to seriously investigate this wealthy, politically powerful alternative. We must examine what Hanscom can contribute to the solution. It has two parallel runways with instrumentation and length that are perfectly suited to commuter aircraft. In fact, it offers double the advantages of a runway 14/32 at Logan. No one should propose that large-scale jet operations emanate from Hanscom, but it does offer a perfectly suited, already existing facility for the commuter traffic that Logan is so anxious to eliminate.

A NEW AIRPORT

Even if the new runway is built, Massport has not addressed how passengers will get there to use it. There are still only the same number of roads in and out. Multi-modal techniques of getting passengers to the airport have grown but in no way have they been able to keep pace with the rise in private automobile traffic to Logan. Despite the new garage, adequate parking will continue to be a problem. Pedestrians will continue to navigate at their peril at this airport. Airport emissions will still waft into abutting neighborhoods.

In this EIR, Massport never even considered the idea of building a brand new international airport. That is a mistake. They must at least seriously consider the concept. Whether there are land parcels in Massachusetts large enough to accommodate such a facility needs to be investigated. Whether an airport can be built on any of them needs 91.14

to examined. To completely dismiss the idea out of hand is not within the intent of the MEPA guidelines for alternatives.

SUMMARY

→ Massport has not followed the NEPA/MEPA regulations and guidelines in how it has produced this report. It has done a very poor job of examining alternatives and pursuing them in any meaningful depth. The report must be done again. 91.15

→ Massport has chosen out-dated and worst case scenario delay data to bolster its case for the new runway 14/32. Its data analyses were not based upon normal FAA data-gathering methods. Less than 4% of all the flights at Logan are delayed. 91.16

→ The land upon which Logan International Airport stands is too small. It cannot handle any more runway growth. It is out of space for any type of additions. 91.17

→ Massport's administration has circumvented and dishonored its own citizen and business group, the ARC, by ignoring the ARC's stated mission and by trying to manipulate the MEPA process to its advantage rather than using the EIR process to produce good, new information and enlightened public aviation policy. 91.18

→ Massport has been greatly concerned with last year's $313 million loss which they assert has been incurred by delays to both the airlines and the passengers. In fact, their figure is only 20% of what workers and businesses on the ground have incurred as part of the "interruption delay factor". That amount of money may be as great as one billion dollars or more per year. 91.19

→ Massport has resurrected the unused-for-a-decade Preferential Runway Assignment System to bolster their weak arguments for a new runway. Should Massport's plans come to pass, then the Authority must be substantially fined for not meeting those goals with the funds going to affected communities.

→ Massport refuses to incoporate a legal document into the FAA Record of Decision that swears that runway 14/32 will be used uni-directionally in pepetuity. 91.20

→ Massport has used Greene and Manchester Airports' growth as a fallback to defend its lack of a comprehensive aviation planning document for Massachusetts for the twenty-second century. 91.21

→ Massport claims to have sincere interest in developing Worcester Airport's potential. If that is so, let them advocate for a compressed development timeframe and the funds necessary for Massport to purchase the airport, increase its infrastructure and build a linking highway to the Massachusetts Turnpike. 91.22

→ Massport must examine the potential use of Hanscom Field as the major operator for commuter operations for Massachusetts. That does not include large scale jet traffic. 91.23

→ As one of the considered alternatives, Massport must study the prospect of siting a new major international airport in Massachusetts. 91.24

When it comes to Logan Airport, Massport has used the "Field of Dreams" philosophy of aviation planning - "build it and they will come". But how will they come, and where will they park, and how will they walk, and how will the neighbors thrive and hear their children laugh, and how will all of the long-suffering citizens enjoy the "Life, liberty and pursuit of happiness to which we all are heir"?

EXHIBIT TWO - BERNICE MADER TO EOEA/MEPA - LOGAN EIR

MODEL FOR "INTERRUPTED DELAY" FACTOR

Boston's population of 628,400 [1998 census data]
Add 222,000 daily in-bound commuting workers
Subtract 12,000 people who live in Boston and work elsewhere
Total of 838,400 people in the City of Boston work under the noise

Add the populations from the other 18 communities, which is 837,400, to the 838,400
Total population under the flight path noise 1,675,800 [This figure is adjusted downward by 12% to account for those people who might live in affected communities and also work in Boston.]

Approximately 62%, or 1,055,750 of the 1,675,800 work under the flight paths.

Boston's average annual income [census data, 1998] $37,740 which is $18.14 per hour based upon a 40 hour work week at 52 weeks per year

Model's conservative rate per working hour is $7.00

Formula Steps:
1/3 of the 1,055,750 or 352,000 + - people receive noise for 3 + - days x 6 + - hrs./day

5 minutes of interruptions for each of the 6 hours = 30 minutes of interruptions per day

3 days of 30 minutes of interruptions = 90 minutes of interruptions

90 minutes of interruptions for 1,055,750 persons = 95,017,500 minutes of lost work

Those 95,017,500 minutes convert to 1,583,625 hours of lost work

At $7.00 per hour, that = $11,085,375 per week in lost work

$11,085,375 x 52 weeks per year = $576,439,500 per year in interruption delay costs

At $18.14 per hour, the 1,583,025 hours of lost work = $28,716,075 per week

At $28,716,075 per week x 52 weeks = $1,493,235,822 per year in interruption delay costs to those businesses and workers who work on the ground under the noise

This model has used a similar technique to the one Massport used to arrive at the $313million of losses attributed to passengers and airlines at Logan

Massport's loss figure of $313 million is only 20% of the losses to those on the ground

Letter 91
Community Advisory Committee Representative, Quincy
Bernice Mader

Code	Topic 1	Topic 2	Comment	Response
91.1	Delay	Model	...their data are old; they used their own rather than the FAA's formula to model delays. They have data from 1998, why don't they use it?	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport. The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
91.2	Regional Transportation	Regional Alternatives	Massport dismissed all consideration of other alternatives in less than a few pages....	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
91.3	Environmental Review Process	MEPA, FAA/NEPA	...Massport has violated both the spirit and the regulations of the EPA, MEPA, and the FAA....	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
91.4	Delay	Model	...Massport has used both outdated and worst case scenario data as their base case and they have employed highly irregular data-gathering methodologies.	In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
91.5	Purpose and Need	Delay	Massport never examines Logan Airport itself as it now exists. They talk extensively about delays but they never mention the real problem at the airport — its size...is only 48% of the minimum physical size of any new airport created today.	Massport is constantly examining Logan Airport's current and future needs. The *1999 ESPR* (previously GEIR) is the latest in a series of intense reviews. Logan Airport's real estate is admittedly less than the desirable size. Since the existing area cannot be expanded, Massport proposed the Airside Project and is investigating other redevelopments to maximize efficiency. Runway 14/32 will be located on fill that was prepared for this purpose 25 years ago. The runway will not increase airfield capacity, but will dramatically reduce aircraft and passenger delays during northwest wind conditions.
91.6	Regional Transportation	Regional Airports	Massport clearly did not formulate a comprehensive Master Plan for Massachusetts' aviation needs of the twenty-second century. As one reads the EIR, it is clear that Massport has not fully answered the requirements of the EIR process. The coverage given to the listed alternative choices is complete lipservice [sic]...Their study is inadequate and outdated and incomplete. It needs to be re-done.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
91.7	Environmental Review Process	Public Process	Concerned about how Massport handled the public process.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
91.8	Delay	Model	When Massport chose its base year for delays it chose the single worst year for delays that had ever occurred. That base year, 1993, was neither indicative nor typical of a normal year...The snowfall of 96.3 inches...set a record...Massport does not clearly delineate which portions of the delays caused by "wind and weather" were specifically attributable to snow, ice or other severe weather conditions....	In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. The delays analysis used ten years of weather data so the characteristics of the weather in a single year did not strongly influence the results.
91.9	Delay	Model	...Massport did not use the FAA method of calculation...the cost of delays was said to be $313 million dollars...What methods were used by DOT and Massport to determine those numbers?	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport. The cost of delay analysis presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is based on a methodology recommended by the FAA. The cost of delay to a passenger ($27 per hour) is a weighted average cost for business and leisure passengers. Refer to FAA APO Bulletin APO-97-1.
91.10	Noise	Impacts	...they have imagined the noise impacts for those living on the ground as being only environmental, with no economic effects. That is a mistake.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..."

Code	Topic 1	Topic 2	Comment	Response
91.11	Noise	Runway Use	...Massport chooses to assert that all of its uni-directional commuter flights would enter and leave Logan via the harbor approach. What Massport does not say or clearly demonstrate is where those thousands of new commuter operations will turn back over land.	The turboprop departures from Runway 14/32 are shown on Figure 6.2.4 of the Airside Project Draft EIS/EIR to cross the harbor and then the South Shore in areas that, for the most part, are currently overflown. Jets are shown on Figure 6.2.3 of the Airside Project Draft EIS/EIR to depart over the harbor, just as jets departing Runways 22L, Runway 22R, and Runway 15L do currently. The jets recross the North and South Shores in the same areas and altitudes as do the current departures from Runway 22L, Runway 22R, Runway 15L, Runway 9, and Runway 4R.
91.12	Alternatives	Runway 14/32	...there is no reason whatsoever to believe Massport's assertion of uni-directionalism....	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Appropriate supporting documentation will also be issued (*e.g.*, appropriate designations in the Airport/Facility Directory, and Notices to Airmen or NOTAMS). Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
91.13	Regional Transportation	Regional Airports	If Massport is serious in its claims about Worcester Airport, then it will acquire Worcester and work with the Massachusetts Highway Department to build a direct connector road from the Massachusetts Turnpike to the airport...We must examine what Hanscom can contribute to the solution.	The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's Alternative Fuels Vehicle program and on Massport's efforts to encourage the use of alternative fuel vehicles. Massport supports improved ground access to Worcester Regional, T.F. Green/Providence, Manchester and Logan airports. These projects are discussed in Section 2.9 of the Supplemental DEIS/FEIR. Since passengers do not travel between New England's regional airports, (*e.g.*, passengers do not first go to Manchester Airport before driving to Logan Airport) it is not clear why improved access between the regional airports would generate any benefit. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
91.14	Regional Transportation	Regional Airports	...Massport never even considered the idea of building a brand new international airport. That is a mistake. They must at least seriously consider the concept.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
91.15	Environmental Review Process	FAA/NEPA MEPA	Massport has not followed the NEPA/MEPA regulations and guidelines...It has done a very poor job of examining alternatives....	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
91.16	Delay	Model	Massport has chosen out-dated and worst case scenario delay data....	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 29, 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 1999 to 2020 time frame.

Code	Topic 1	Topic 2	Comment	Response
91.17	Alternatives	Runway 14/32	The land upon which Logan International Airport stands is too small. It cannot handle any more runway growth.	Logan Airport's real estate is admittedly less than the desirable size. Since the existing area cannot be expanded, Massport proposed the Airside Project and is investigating other redevelopments to maximize efficiency. Runway 14/32 will be located on fill that was prepared for this purpose 25 years ago. The runway will not increase airfield capacity, but will dramatically reduce aircraft and passenger delays during northwest wind conditions.
91.18	Environmental Review Process	Public Process	Massport's administration has circumvented and dishonored its own citizen and business group, the ARC, by ignoring the ARC's stated mission and by trying to manipulate the MEPA process to its advantage....	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
91.19	Purpose and Need	Delay	Massport has been greatly concerned with last year's $313 million loss...their figure is only 20% of what workers and businesses on the ground have incurred as part of the "interruption delay factor".	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
91.20	Alternatives	Runway 14/32	Massport refuses to incorporate a legal document into the FAA Record of Decision that swears that runway 14/32 will be used uni-directionally in perpetuity.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Appropriate supporting documentation will also be issued (*e.g.*, appropriate designations in the Airport/Facility Directory, and Notices to Airmen or NOTAMS). Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
91.21	Regional Transportation	Regional Airports	Massport has used Greene and Manchester Airports' growth as a fallback to defend its lack of a comprehensive aviation planning document for Massachusetts for the twenty-second century.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
91.22	Regional Transportation	Regional Airports	Massport claims to have sincere interest in developing Worcester Airport's potential. If that is so, let them advocate for a compressed development timeframe and the funds necessary for Massport to purchase the airport, increase its infrastructure and build a linking highway to the Massachusetts Turnpike.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. MassHighway is in the process of preparing a Draft EIS/EIR, which is expected to be filed in October 2001. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other alternative regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Section 2.2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. MassHighway is analyzing alternative routes that would improve surface access from Routes I-90 and I-290 to the Worcester Regional Airport. MassHighway filed an ENF in December 1999 and is in the process of preparing a Draft EIS/EIR, which is expected to be filed in October 2001.

Code	Topic 1	Topic 2	Comment	Response
91.23	Regional Transportation	Regional Airports	Massport must examine the potential use of Hanscom Field as the major operator for commuter operations for Massachusetts. That does not include large scale jet traffic.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
91.24	Regional Transportation	Regional Airports	As one of the considered alternatives, Massport must study the prospect of siting a new major international airport in Massachusetts.	Comment noted.

LETTER 92

April 21, 1999

Mr. Robert Durand, Secretary
Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street, 20th floor
Boston, MA 02202

Dear Mr. Pugsley:

Thank you for this opportunity to comment on the Massport/Federal Aviation Administration DEIS/DEIR. As a member of the Community Advisory Committee to Logan Airport ("CAC") I have been involved in this issue since its inception. As you know, the CAC was one component of the Airside Review Committee ("ARC") formed by Massport to provide input into the process during the development stages, the other being comprised of representatives from the business community. I concur with the report filed by the Consultants to the CAC and would like to take this opportunity to emphasize some points raised in their report.

I first want to point out the lack of public participation in this process. From the first, the CAC's involvement in the ARC project was minimal. There was no interaction between the CAC and Massport other than that which occurred at the irregularly scheduled meetings when Massport and their consultants presented their latest findings. If the CAC requested additional information beyond that presented by the Massport consultants, we were told either that it was not available or that the information we requested would be in the final report or that Massport was paying for a CAC consultant and the CAC could do our own analysis. Our complaints about the lack of comparable data (e.g. use of hours of delays rather than number of operations delayed, percentage increases in regional airports rather than actual operations, etc) produced no results. The Massport consultants steadfastly refused to provide any data that the CAC could use to counter the predetermined outcome of the study, which was that construction of Runway 14/32 was necessary. The DEIS/GEIR is unnecessarily complicated

92.1

by the lack of comparable data through out the report and I suggest that MEPA deny Massport's application until all data regarding delays, traffic at Logan and regional airports, increased capacity, etc. is stated in number of operations. 92.2

From the public testimony of the members of the business component of the CAC, it appears that the business community was extensively consulted on various matters, most significantly the option of peak hour pricing. Massport's selection of alternative 2 as the preferred alternative is a business decision, not an environmental impact decision. The alternatives that include peak hour pricing clearly show a significant, timely delay reduction with minimal environmental impact. Massport's not very impartial study of the impacts of peak hour pricing on the small carriers should be discounted. Massport's claim that peak hour pricing has not been implemented because some communities will lose service is ludicrous. People don't cancel their vacation of business trips because the cost goes up ten dollars. Surely it is preferable for airline passengers to pay another ten dollars to spare the Boston area additional noise and environmental pollution. If Massport is so concerned with the loss of service to the communities served by the regional airlines, then Massport should subsidize them. 92.3

Not only did Massport ignore the requests of the CAC, Massport also has not performed its duty to inform the general public of the potential impacts of Runway 14/32 and of the existence of the MEPA process. Boston's South End neighborhood has not been graced with a visit from Massport, despite numerous requests by city councilors and state representatives. Massport has also not deigned to respond to the many requests of the Cambridge City Council for a meeting with them and the residents of Cambridge. Surely it can not be a coincidence that communities that can expect increases of to 300% were ignored, while every chamber of commerce in the eastern portion of Massachusetts has been recruited by Mr. Blute. Massport has made no attempt to publish the existence of the MEPA process in local papers. If community members did not inform them, citizens would not be aware of the potential impacts and the opportunity to comment to MEPA. MEPA should deny the DEIS/DEIR until every impacted community and their elected representatives have been visited by Massport and have been given the chance to submit their comments to MEPA. 92.4

As the report of the CAC consultants makes clear, Massport can not deliver on its promise of maintaining Runway 14/32 as a unidirectional runway in perpetuity. Peter Blute claims that he will reach an agreement with the FAA which will substantiate this claim, but after three months, where is it? Even if such an agreement could be created, it could easily be overturned by an agency that is already seeking to overturn a state court injunction. What possible agreement could Massport and the FAA create that

could be stronger than a court injunction? Massport is very careful to point out that they are not *currently* filing for the permits to create a bi-directional runway. There is, of course, nothing to stop them from doing so in the future. Massport is deliberately breaking their expansion scheme into small bits that MEPA will be forced to allow under the letter of the law. Massport is using the process designed to protect the environment against MEPA. As there is no substantiated agreement regarding uni-directional status of Runway 14/32 I urge you look beyond the current request and force Massport to calculate the impacts of a *bi-directional* Runway 14/32.. (Actually, I can't understand why MEPA is reviewing permits for construction of a runway already prohibited by Massachusetts. Isn't this process backwards? Shouldn't Massport succeed in lifting the court injunction before the DEIR/DEIS is filed?) 92.5

Massport's filing also touts the potential improved compliance with the noise goals set forth in the Preferential Runway Advisory System (PRAS). Once again, Massport and the FAA can not keep this promise. The FAA has refused to guarantee improved compliance, even after factoring out poor weather conditions. I request that you ask Massport to calculate noise impacts using *actual* runway usage, not some unobtainable goal. 92.6

Massport's noise contours are also misleading. They used only five tracks per runway to calculate noise impacts – and I doubt they used the extremes. In addition, the area impacted by Runway 27 departures has been severely understated. Runway 27 departures fly over the densely populated inner city communities of South Boston, the South End Roxbury and Jamaica Plain. As the current Runway 27 departure flight track was not in use in 1993, Massport has used the "optimal" departure tracks rather than the current actual in their DEIS/DEIR. According to radar tracks released in February 1999, a mere 38% of Runway 27 departures are adhering to the flight track used by Massport to calculate noise impact. Even worse, Massport and the FAA have given up on improving Runway 27 compliance and told the public to learn to live with it. At the very least, Massport should use the current actual flight tracks to calculate noise impact in the DEIS/DEIR. 92.7

As the Runway 27 situation has unfortunately proved, any commitments made by Massport and FAA are only as good as their subsequent compliance. The public needs the *subsequent, ongoing* involvement of MEPA and other environmental agencies to ensure that Massport and the FAA keep the commitments they have made to the communities. Any agreements regarding sound proofing, uni-directional status and adherence to PRAS goals need to be fully defined, documented and signed off by all parties, including the communities and their elected officials. The agreements should mandate subsequent review and corrective measures, including punitive monetary damages and the voiding of any 92.8

environmental permits granted in the event of non-compliance. Community members and their elected officials need to have a true voice in the ongoing review process, rather than the lip service Massport currently gives public input and community participation should be required in the drafting of the agreements. The agreements should also be included as an integral part of Massport's filing with MEPA. Agreements binding parties to their commitments are a normal part of the business world and I fail to understand why the environmental process does not require them. No rational business person would enter into a contract which included such unsubstantiated promises. If the data submitted by the CAC consultants is not sufficient to allow you to deny Massport's request, I urge MEPA to make your approval contingent upon the creation of contracts to protect the public and ensure that Massport and FAA honor the commitments they have made to the impacted communities.

Sincerely,

Kurt H. Walter

92.1	Environmental Review Process	Public Process	... I first want to point out the lack of public participation in this process...The Massport consultants steadfastly refused to provide any data that the CAC could use to counter the predetermined outcome of the study....	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
92.2	Environmental Review Process	MEPA	...I suggest that MEPA deny Massport's application until all data regarding delays, traffic at Logan and regional airports, increased capacity, etc. is stated in number of operations.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
92.3	Alternatives	Preferred Alternative	Massport's selection of alternative 2 (sic) as the preferred alternative is a business decision, not an environmental impact decision. The alternatives that include peak hour pricing clearly show a significant, timely delay reduction with minimal environmental impacts.	Alternative 1A is the preferred alternative. The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline Analysis of PPP is set out in Section 4.5 of the Supplemental DEIS/FEIR.
92.4	Environmental Review Process	MEPA	MEPA should deny the DEIS/DEIR until every impacted community and their elected representatives have been visited by Massport and have been given the chance to submit their comments to MEPA.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. Code	Topic 1	Topic 2	Comment	Response
92.5	Environmental Review Process	MEPA	...I urge you look beyond the current request and force Massport to calculate the impacts of a *bi-directional* Runway 14/32.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Appropriate supporting documentation will also be issued (*e.g.*, appropriate designations in the Airport/Facility Directory, and Notices to Airmen or NOTAMS). Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
92.6	Noise	PRAS, Runway Use	I request that you ask Massport to calculate noise impacts using *actual* runway usage, not some unobtainable goal (referring to Preferential Runway Advisory System).	During very high demand periods, the controllers have little or no flexibility for runway selection and PRAS recommends an appropriate runway configuration given the extant demand. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals. The Supplemental DEIS/FEIR demonstrates that the controllers have been improving performance with respect to PRAS recommendations. Section 8.5 of the Supplemental DEIS/FEIR contains methods for more comprehensive monitoring of PRAS. These methods will be implemented as part of the mitigation program for the Airside Project.
92.7	Noise	Model	Massport's noise contours are also misleading...Massport should use the current actual flight tracks to calculate noise impact in the DEIS/DEIR.	The noise analyses in the Airside Project Draft EIS/EIR are based on radar descriptions of the current existing flight tracks, except for the departure track for Runway 27. The departure flight track for Runway 27 is changing to the flight track recommended in the Runway 27 EIS. For studies of future events, a set of tracks more representative of the recommendations is appropriately used.
92.8	Environmental Review Process	MEPA	...I urge MEPA to make your approval contingent upon the creation of contracts to protect the public and ensure that Massport and FAA honor the commitments they have made to the impacted communities.	Massport's mitigation measures are reinforced through compliance with M.G.L. Chapter 30A, Section 61 and through specific state and federal certificates approving projects that have mitigation. The status of the Section 61 Finding commitments are tracked and reported in the *Logan Airport 1999 ESPR* (previously GEIR). See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.

LETTER 93

D.A.N.A.

Dorchester Allied Neighborhood Associations

One Barna Rd

RE: LOGAN AIRSIDE IMPROVEMENTS PLANNING PROJECT
DRAFT ENVIRONMENTAL IMPACT STATEMENT/REPORT
EOEA #10458

Dear Secretary Durand:

Dorchester Allied Neighborhood Associations (D.A.N.A.) represents the many diverse residents and neighborhoods of Dorchester as individuals and through their crime watch and civic and neighborhood associations. I am the Dorchester Representative appointed by D.A.N.A. to the Community Advisory Committee to Massport. At the April 1999 D.A.N.A. meeting, a motion was made, duly seconded and unanimously passed to oppose any expansion of Logan International Airport. D.A.N.A. is opposed to the construction of new runways, specifically Runway 14/32 and we are opposed to the construction of additional taxiways.

The expansion of Logan International Airport must be stopped. Logan International Airport was built in a residential setting. While this may not have posed a problem 75 years ago, today the increased dependence on air transportation in a densely populated urban area makes this unacceptable. The residents of the neighborhoods of Boston, including Dorchester, and all the surrounding communities today suffer an unacceptable level of noise and air pollution. No amount of noise mitigation will solve the problem we face when our windows are open or when we go outside. No amount of noise mitigation will address the very high levels of asthma and other respiratory illness suffered by the residents of Boston.

Massport must not waste taxpayer money building runway 14/32. Instead, they must diligently pursue and maximize the use of an intermodal regional transportation system. The use of several airports located in various metropolitan areas does not solve the problems of noise and air pollution in the city, it only spreads it around. The major growth in the area is outside the Interstate 495 area. With Fort Devens located less than an hour from Boston, the construction of a New England international regional airport at Fort Devens with high speed rail links to the major metropolitan areas is the most responsible approach.

Massport has stated that for Boston to be a "world class city" that attracts tourists and conventioneers, Logan International Airport must expand. Boston is the

grand dame of American cities, with considerable historical significance made up of many unique neighborhoods. For Boston to be a "world class city" we must support the neighborhoods. Otherwise, Boston will have no neighborhoods, and she will become a giant convention center, and business and industrial park. Neither tourist nor conventioneers will be interested in coming to Boston.

Ultimately, the environmental disaster called Logan International Airport must cease to exist, returning to Boston and Winthrop the land that was theirs. Dorchester, East Boston and all the surrounding communities deserve this.

Three significant items which the DEIS/EIR does not adequately address are: 93.1
•No credible case is made for building the proposed Runway 14/32 as a means to solve operational delays at Logan International Airport. It is a thinly veiled capacity enhancing project which will negatively effect large numbers of people. 93.2
•The socio-economic and environmental effects from the proposed project on the inner city and the greater metropolitan Boston area is not adequately addressed. 93.3
•The noise contour maps are illegible, making it impossible to determine which communities are most adversely effected by which contour, it is not a full disclosure document.

On behalf of D.A.N.A. and myself, I support the Review Comments on Draft Environmental Impact Statement/Draft Environmental Impact Report for the Logan Airside Improvements Planning Project as presented by Massachusetts Port Authority dated February 1999, prepared by Robert G. Burns of Monty Gettys, Montgomery Consulting Group, In., David Standley, P.E., Consultants to the Community Advisory Committee to Massport for the Community Advisory Committee, dated March 29, 1999.

Therefore, we respectfully request that MEPA find the DEIS/EIR to be inadequate and return it to the Massachusetts Port Authority.

Sincerely,

Pamela A. Smith
Dorchester Representative
Community Advisory Committee to Massport

93.1	Purpose and Need	Delay	No credible case is made for building the proposed Runway 14/32 as a means to solve operational delays at Logan International Airport. It is a thinly veiled capacity enhancing project which will negatively effect [sic] large numbers of people.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
93.2	Environmental Justice	Impacts	The socio-economic and environmental effects from the proposed project on the inner city and the greater metropolitan Boston area is not adequately addressed.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.
93.3	Noise	Studies	The noise contour maps are illegible....	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.

LETTER 94

Mr. Robert Durand
Secretary of Environmental Affairs
Commonwealth of Massachusetts
100 Cambridge St., - 20th floor
Boston, MA 02202
ATTN: Arthur Pugsley
MEDA Unit
File Number – 10458

Dear Secretary Durand:

As the Representative on the Community Advisory Committee from the City of Malden, I must oppose the expansion of Logan Airport. There are other alternatives and options that exist and should be implemented before a new runway and taxiway are employed. Other airports could help relieve the congestion at Logan. New Bedford Airport is begging for improvements so they can become a reliever airport. Hanscom Airport in Bedford, has existing runways which could handle any aircraft, yet Massport will not consider using it for anything other than what it is being used for now, despite the fact that it lost 1.9 million dollars last year. The fact that 54% of Logan passengers come from 128 and beyond makes Hanscom a perfect location for another usable airport. 94.1

The EIS/EIR is a flawed report that should be withdrawn. It uses 1993 as the base year, but was not released until 1999. The weather data used is from 1981-1990, and weather patterns have changed since then. This report only goes out to the year 2010, which is only 11 years away. If the proposed expansion were to go forward, its completion date would be 2005. By Massports estimates, the delay problem will be worse in 2010 than it is today, even with the expansion, yet they have no plan to deal with this problem. This is a shortsighted approach to a long-term problem. A 20-year outlook should be used, and a second major airport study should be revisited. Peak hour pricing and the expanded use of other airports, along with improved infrastructure to Worcester Airport are all options that should be implemented before any Logan improvements are considered. 94.2 94.3 94.4

-Sincerely,

John J. Mahoney
Malden CAC Representative

Letter 94
Community Advisory Committee Representative, Malden
John Mahoney

Code	Topic 1	Topic 2	Comment	Response
94.1	Regional Transportation	Regional Airports	There are other alternatives and options that exist and should be implemented before a new runway and taxiway are employed.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
94.2	Analysis Assumptions/ Methodologies	Base Year	...It uses 1993 as the base year, but was not released until 1999. The weather data used is from 1981-1990, and weather patterns have changed....	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. Comparative analysis of 1981 to 1990 weather with 1989 to 1998 weather identifies no significant differences in statistical properties.

Code	Topic 1	Topic 2	Comment	Response
94.3	Analysis Assumptions/ Methodologies	Planning Period	This report only goes out to the year 2010, which is only 11 years away...A 20-year outlook should be used....	Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.
94.4	Alternatives	Peak Period Pricing	Peak hour pricing and the expanded use of other airports... should be implemented before any Logan improvements are considered.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. Analysis of PPP is set out in Section 4.5 of the Supplemental DEIS/FEIR. Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

4/20/99

Dear Mr. Pugsley,

LETTER 95

The community of Hingham has not been fairly considered in the EIS/EIR produced by MASSPORT. Therefore, I oppose the proposed runway expansion.

CURRENTLY, we experience over our neighborhood, 1 flight per minute at low altitude, for HOURS ON END. Having a conversation outside is next to impossible. We get woken up at night.

What is the impact on our CHILDREN'S HEALTH WITH THE PRESENT NUMBER OF FLIGHTS OVER OUR NEIGHBORHOOD? 95.1
Does the fact that our state park (Wompatuck) and our reservation lands offer no solitude because of MASSPORT operations?

IF THIS IS NOW, WHAT ARE WE SUPPOSED TO DO WHEN FLIGHTS OVER HINGHAM TRIPLE? Is the developing of Boston as a corporate convenience center more important to NEPA than the VERY REAL impact of MASSPORTS operations currently and in the future to our community's environmental and public health?

In the name of God and upholding the spirit of your position, I ask you to find this environmental impact statement inadequate and to recommend a regional solution to this issue. Thank you. 95.2

Sincerely,

Richard Goldhammer
CAC representative
Hingham, Massachusetts

Letter 95
Community Advisory Committee Representative, Hingham
Richard Goldhammer

Code	Topic 1	Topic 2	Comment	Response
95.1	Noise	Impacts	What is the impact on our CHILDREN'S HEALTH WITH THE PRESENT NUMBER OF FLIGHTS OVER OUR NEIGHBORHOOD?...WHAT ARE WE SUPPOSED TO DO WHEN FLIGHTS OVER HINGHAM TRIPLE?	There is no evidence to suggest that the levels of environmental noise generated by Logan Airport are a health risk to residents. This is especially true in Hingham where DNL levels from Logan Airport overflights are on the order of 55 dB or less, some 20 dB below the highest exposure levels experienced by communities much closer to Logan Airport.
95.2	Enviromental Review Process	MEPA	...I ask you to find this environmental impact statement inadequate and to recommend a regional solution to this issue.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Joseph S. Gulino
Melrose Representative to the Logan CAC

LETTER 96

25 Apple Hill Road
Melrose, MA 02176

April 20, 1999

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley, EOEA No. 10458
100 Cambridge Street - 20th Floor
Boston, MA 02025

Dear Secretary Durand:

I am writing to ask you for your help in opposing Massports expansion plans for Logan Airport.

It is my feeling that given Massports increased air traffic projections, that this new runway does not begin to address delays at Logan Airport.

Massport is projecting an increase in flight operations from the current 500,000 per year to 750,000 per year. Yet this new runway is projected to handle only 75,000 flights per year. Where will the other 175,000 planes go, and how will existing delays improve under this scenario? By the time this new runway would be operational, any temporary relief would be marginal at best.

Massport argues that this new runway will provide relief to the communities surrounding the airport. That seems to be at odds with the opinions of the people who live in those communities.

I, too, am one who fails to see this conclusion. What I see is Massports ability to increase flight operations to a guaranteed 120 average operations per hour, from an existing average of 90 operations per hour now. This would seem to me to be an expansion plan, and not a delay reduction plan, and this would also seem to place a greater burden on the communities, not any relief.

I would argue that the burden of airport traffic should be shared by all communities that use the airport, kind of like a "pay to play" rule. By this I mean that Logan is at its capacity and by Massports estimates, 40-60% of the people who use Logan live outside of the Route 128 belt.

Logan is only 1,200 acres, and, as many Major airports go, relatively small in comparison to the newer, major 10,000 acre airports that have been built or expanded around the country.

I support Mayor Menino, Congressman Markey, Congress Capuano and other political and social leaders, as well as the the community group CARE's recommendation for a blue ribbon commission to study and strategize on our regional transportation system and to look for long term solutions to the Commonwealth's transportation needs, including the siting of a new major airport. 96.1

This would alleviate safety and environmental concerns in the immediate Metropolitan area of Boston including but not limited to reductions in air and ground transportation in the City of Boston, reductions in noise and air pollution, and an increase in quality of life issues, etc., etc..

I find it unconscionable that Massport to date has spent Millions of dollars, considers this new runway to be a delay reduction plan, and at the same time admits that they have failed to look at any long term solutions that are obviously necessary to bring our air transportation system into the 21st century.

Massport claims to be a good neighbor, and yet, as the City of Melrose representative to the CAC, I am a bit confused by this claim. I asked massport at a meeting of the Airside Review Committee (ARC), if they would come to our City to explain to our Mayor, Board of Alderman and our homeowners and taxpayers the effects of this new runway on our community. Betty Derosier, with Director Peter Blute, standing right there, said that they would. But when I called at the request of our Mayor and Board of Alderman to schedule this meeting, Massport's response was " we have reconsidered our position with respect to individual community presentations" (see attached letter). 96.2

Melrose has and continues to experience an increase in air traffic and noise, and I have come to the belief that it is expected to triple. Today, according to Massports estimates, Melrose experiences 4% of all airport traffic, which will increase to 12%. On current volume of 500,000 operations today, that is currently 20,000 flights per year increasing to 60,000 flights per year over Melrose and will increase to 90,000 flights per year when volume levels reach the expected 750,000 flights per year. Yet Massport doesn't consider Melrose to be adversely impacted. I find this outrageous and ask for your help in holding Massport accountable.

Massport's computer generated flight models do not even show a jet flying over Melrose, yet I can look up in the skies on just about any given day and I can show you many jets flying over Melrose.

Massport was very careful in documenting their public participation quota. However, it is my feeling that they shyed away from any real public participation,

as evidenced by their eagerness to push this project through in two months after a 20 month period of self imposed delay.

I share the sentiments of many that this DEIS/DEIR document is flawed in it's selection of outdated weather and flight data information, its' lack of analysis and/or inclusion of potential solutions to delay and expansion scenarios (i.e. peak period pricing and Hanscom field, etc.) and it is my opinion that it is flawed in it's conclusion that this is the answer to reducing delays and solving the Commonwealth's air transportation needs. 96.3

I urge you to join the political and social leaders, and the communities and the people who oppose this new runway and proposal, until such time as Massport updates it's data and considers and includes some long term solutions to this air transportation problem.

Boston is a World Class City, and the people and businesses of the Commonwealth deserve a World Class and Long Term solution to their air transportation needs.

Thank you very much for your help.

Very Truly Yours,

Joseph S. Gulino,
Melrose representative
to the Logan CAC

96.1	Enviromental Review Process	Blue Ribbon pANEL	I support...recommendation for a blue ribbon commission to study and strategize on our regional transportation system....	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. As summarized in the Draft EIS/EIR, a number of studies that address regional transportation planning issues have been conducted over the last ten years. These studies have concluded that the Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high speed rail are all necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Chapter 2 of the Supplemental DEIS/FEIR discusses the entire region's air transportation system, along with a discussion of alternative modes, specifically high-speed rail, and describes the regional study and its major conclusions.

Code	Topic 1	Topic 2	Comment	Response
96.2	Environmental Review Process	Public Process	Concerned about openness of public participation process.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
96.3	Delay	Model	...document is flawed in its selection of outdated weather and flight data information, its lack of analysis and/or inclusion of potential solutions to delay and expansion scenarios (i.e. peak period pricing and Hanscom field, etc.)....	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. Analysis of 1981 to 90 weather with 1989-98 weather identifies no significant differences in statistical properties. The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport is prepared to initiate a process, as described in Section 4.5.4 of the Supplemental DEIS/FEIR, to initiate the rule-making process to implement PPP at that time. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.

20th Floor
Boston, MA 02202

RE: Draft EIR logan Airside Improvements - EOEA #10458

Dear Mr. Pugsley:

For over two years as Revere's alternate CAC, I have attended CAC meetings, reviewed the draft EIR, and attended several Massport Presentations to various neighborhoods. I feel that the proposed Logan Airside Improvements are unfair to the "close-in" neighborhoods and that the "improvements" offer no serious long term relief to the impacted neighborhoods. I also believe that the main thrust of the "improvements" is not to reduce delays, but to optimize the capacity of Logan so more flights may be accomodated.

1. Reduction of the Decision Point Minimum

We are opposed to the lowering of the decision point minimum on runway 22L. To quote from the draft EIS/EIR: "If the reported visibility at the airport is less than the published minima for the approach, the pilot must wait until the weather improves, use another runway or divert to another airport."[1] Reducing the minimum will allow more planes to land in inclement weather. This will mean more planes on runway 4/22 during bad weather and would allow an operating gain of 94 hours to Massport. At 35 planes landing an hour, Revere would have an increase of approximately 3200 operations. The Beachmont hill in Revere is 120 feet with a 50 foot building on top. Planes are flying at less than 500 feet at this point over our homes and they are less than 300 feet over the elderly housing. 97.1

In Massports presentation at the VFW in Beachmont Massport explains how the lowering of the minimum will benefit Revere by changing the decision point closer to the airport. This brings the decision point over East Boston. In Massports presentation at the Orient Heights Yacht Club the slide showing the decision point was omitted. Was this because it does not benefit the Orient Heights neighbors?

I ask that you find the Draft inadequate in this matter, especially since the subject did not appear in volume one. Most people did not even review this as they did not receive volume 3 technical appendix in which this subject is referenced. The document also does not indicate that a 50 foot building is atop Beachmont Hill and implies a false perspective.

---

[1]Logan Airside Improvements Planning Project. Volume 3 p.1 "overview"

2. Runway 14/32

Runway 14/32 has been presented to the community as a way of reducing delay for Massport. It is also purported to distribute operations more evenly amongst neighboring communities. The new runway will allow Massport to operate in high Northwest winds. This does not affect operations on 4/22 which cannot be used in this weather. So there is no relief to us in high Northeast winds with 14/32 operating. With mild weather conditions 14/32 could possibly provide some relief to our community. However with Massports growth projections, our neighborhood will return to the same intolerable level in just a few years. 97.2

3. Proposed Centerfield Taxiway

The new centerfield taxiway will make runways 4/22 more attractive to use. This would offset the purpose of sharing the burden of operations with other communities. PRAS goals have not been met in the past and this "improvement" will certainly not provide relief to Revere, East Boston, or Winthrop. 97.3

4. Noise

The Draft EIR addresses noise with updating aircraft's to Stage Three. Currently 85% of operation at Logan are Stage Three and all late night operation are restricted to Stage Three. Stage three is still a very noisy aircraft, loud enough to wake you up at 3AM. Therefore Stage Three is inadequate in resolving noise pollution. It should be mandated that all aircraft be no louder than 65 decibels. 97.4

The Draft EIR does not provide any long term solution to Massports propensity to grow, nor does it address the consequences to the impacted communities, the injustice to the "close-in" communities. 97.5

I am a life-long resident of Beachmont , the most highly impacted area of Revere, living within the 70 to often well above 85 decibel noise contour from Logan. Sound -proofing is not suitable mitigation for the environmental injustice inflicted upon us. We need strict night time curfews, effective from 10PM to 7AM. An operational cap should be implemented at Logan. With limited land size, hasn't Logan really reached it's capacity? Sound-proofing should be expanded to include central air-conditioning. Trees should be planted to absorb some of the noise. Noise and air pollution monitors (such as those requested by our community and not received) should be made available to all impacted neighborhoods. 97.6

Logan as it exist today is here to stay. With its own projection for growth, and subsequent noise, our neighborhoods will be extinct in the future.

The Draft EIR fails to look seriously at a second major Airport, which would be the only real solution for impacted communities. 97.7

Respectfully,

Deborah A. Santiano-McHatton

Code	Topic 1	Topic 2	Comment	Response
97.1	Alternative	Reduced Approach Minima	We are opposed to the lowering of the decision point minimum on runway 22L...This will mean more planes on runway 4/22 during bad weather....	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport does not equate to a reduction in the existing levels of safety. Aircraft would follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach procedure would be initiated would be moved closer to the airport. Ideally, whenever possible, the lowest minimums are used to ensure the greatest availability of a runway during poor weather. Although normally categorically excluded from the NEPA review, the Airside Project study included modeling of changes in runway availability due to reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result. Appendix D indicates a 0.1 percent increase in equivalent jet arrivals on Runway 22 and no increase in equivalent jet departures on Runway 4 with the 37.5M High Fleet and Reduced Minimums.
97.2	Noise	Runway 14/32	...there is no relief to us in high Northeast winds with 14/32 operating. With mild weather conditions 14/32 could possibly provide some relief to our community.	In high northeast winds, Runway 4R is the primary runway. However, in milder northeast winds, Runway 14/32 would provide some relief.
97.3	Alternatives	Taxiway Improvements	The new centerfield taxiway will make runways 4/22 more attractive to use...this 'improvement' will certainly not provide relief to Revere, East Boston, or Winthrop.	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays; thereby reducing associated noise and emissions. When using Runways 22L/R for departures, the Centerfield Taxiway would provide an alternate taxi route for Runway 22L departures to bypass the queue for Runway 22R, thereby reducing taxiway congestion and associated noise and emissions. Runway 22L departures represent less than ten percent of the total departures. Under existing conditions, aircraft needing to depart on Runway 22L (typically heavy jets, such as 747s with long takeoff distance requirements) must wait in the queue on Taxiway November with aircraft departing on Runway 22R. With the Centerfield Taxiway, aircraft departing on Runway 22L could depart quickly after reaching the runway end, and the number of aircraft queuing on Taxiway November should decline. Also, the aircraft on the Taxiway November should be smaller, implying lower noise and air quality emissions. With the addition of Runway 14/32, use of Runways 22R and 22L for departures would decline.
97.4	Noise	Hushkitted Aircraft	Therefore Stage Three is inadequate in resolving noise pollution. It should be mandated that all aircraft be no louder than 65 decibels.	Stage 3 is not the final answer to aircraft noise. However, the retirement of hushkitted Stage 3 aircraft, the continued development of quieter aircraft, and the ongoing research for quieter future aircraft offer significant hope for the future. However, a noise limit of 65 dBA, which is well below the federal limits for automobiles and trucks, is not appropriate for aircraft.

Code	Topic 1	Topic 2	Comment	Response
97.5	Environmental Justice	Impacts	...[The Draft EIR does not] address the consequences to the impacted communities, the injustice to the 'close-in' communities.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
97.6	Noise	Sound Insulation	Sound-proofing is not suitable mitigation for the environmental injustice inflicted upon us.	Sound insulation does not totally mitigate aircraft noise. However, it reduces the noise inside the dwelling unit to improve the indoors environment and reduce the impact on indoor human activities, such as speech communication and sleeping. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative.
97.7	Regional Transportation	Regional Airports	The Draft EIR fails to look seriously at a second major Airport....	Comment noted.

Re: Logan Airside Improvements Planning Project
Draft Environmental Impact Statement/Report, EOEA #10458

Gentlemen:

Enclosed for filing please find the Comments of the Conservation Law Foundation on the Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report submitted by the Massachusetts Port Authority. CLF urges the Massachusetts Secretary of Environmental Affairs and the Administrator of the Federal Aviation Administration to find that the DEIS/R is inadequate, and to require that Massport prepare a Supplemental DEIS/R.

While an extremely valuable asset for Boston and the region, Logan Airport has serious environmental impacts, ranging from the noise impacts of planes to the motor vehicle air pollution attributable to the airport, New England's largest generator of motor vehicle trips. CLF is very skeptical of the need for either expanded runway capacity at Logan or a new regional airport, either to reduce delays or accommodate passenger growth. The sought-after benefits of such facilities can be obtained through less environmentally harmful means: namely, if Logan operated more efficiently (through "peak hour pricing" or other runway pricing reforms) and better use was made of intercity

rail service as well as other regional airports which travelers could reach by environmentally responsible modes of transportation, including rail.

Massport was tasked with analyzing in the DEIS/R whether these measures could be alternative means for addressing flight delays at Logan. Unfortunately, Massport did an inadequate job of performing this analysis. Accordingly, Massport has failed to make its case that the proposed "airside improvements," of which Runway 14/32 is the most prominent example, are the least environmentally damaging way to address the delay question which Massport is ostensibly addressing. If Massport continues to seek to build this runway, it must next, in a Supplemental DEIS/R, fairly and thoroughly assess these important alternative measures.

Massport's failure adequately to consider administrative measures like peak-hour pricing and the potential of rail and other airports as alternative ways of addressing Logan's flight delays is related to a larger and more serious problem: the absence of a regional strategy for dealing with Massport's ominous growth projections for Logan. Massport estimates that, whether or not the proposed runway is built, Logan's present level of 26.5 million passengers per year will grow to between 37.5 and 45 million passengers by 2010. A major regional planning initiative is needed right now -- before additional capacity is provided at Logan -- to address how to plan for this projected demand in the most efficient and environmentally sensitive way possible. While outside the scope of MEPA or FAA formal review, CLF urges Massport and appropriate state agencies in Massachusetts to initiate a planning process, in partnership with officials from Rhode Island and New Hampshire and with other stakeholders from around the region, to develop a workable, sustainable strategy for handling inter-city travel demand in the region. The plan would address both goals for use of rail service and other airports and specific strategies for attaining those goals.

Very truly yours,

Stephen H. Burrington

COMMENTS OF THE CONSERVATION LAW FOUNDATION ON THE LOGAN AIRSIDE IMPROVEMENTS PLANNING PROJECT DRAFT ENVIRONMENTAL IMPACT STATEMENT/REPORT

EOEA No. 10458

April 23, 1999

Submitted by Seth L. Kaplan, Bennet Heart, and Stephen H. Burrington

I. Introduction

The Conservation Law Foundation (CLF), a member-supported, non-profit environmental advocacy organization founded in 1966, has been involved with Logan International Airport related issues for many years. CLF's mission is to work to solve the environmental problems that threaten the people, natural resources, and communities of New England, and the plans and actions of the Massachusetts Port Authority (Massport) at Logan Airport have regularly warranted our attention. Historically, when the subject of meeting increasing demand for air travel in the region has come up, one of two options are put on the table: Logan cannot grow to accommodate projected demand, so we need to build a "second airport" (in a location with no transit/rail access) or Logan needs to grow even if it is at the expense of neighboring communities. CLF has rejected both positions. Several years ago CLF opposed plans to "bank" land for a second regional airport on the grounds that no such facility would be needed if Logan operated more efficiently and better use was made of existing regional airports and rail. CLF has also argued, in comments on Logan plans filed under the Massachusetts Environmental Policy Act (MEPA), that Massport should use "peak hour pricing" to help de-congest Logan's runways and reduce the disproportionate use of the airport by smaller planes.

Massport now comes forward, in the Draft Environmental Impact Statement/Report (DEIS/R) under consideration, with a highly controversial proposal to build an additional runway at Logan -- a proposal Massport unsuccessfully advanced thirty years ago -- and make certain other infrastructure and operational changes. The stated purpose of the runway and the other proposed infrastructure and operational changes is to address flight delays at Logan, not expand Logan's capacity. Given the magnitude of the proposal, the clear direction provided by the Secretary of Environmental Affairs' November 1995 Certificate on the Environmental Notification Form (ENF), and the over three years that Massport has had to prepare this DEIS/R, Massport should have returned with a document containing a first-rate alternatives analysis, both with respect to peak period pricing and other landing fee reforms, as well as the role of other airports and rail travel. Unfortunately, however, the DEIS/R alternatives analysis fails on both counts. First, Massport's submission fails to adequately assess the potential to reduce delays and make Logan more efficient through better administration of the existing airport -- like revamping landing fees and implementing "peak-hour pricing," a measure that would discourage small planes from clogging the airport during busy times. Second, it fails to adequately consider

98.1

the potential of other airports in the region and rail service to, in conjunction with runway pricing reform, handle enough of Logan's present and future business so as to largely alleviate the delay problem flagged by Massport. Most notably, Massport fails to consider the potential for T.F. Green Airport in Warwick, Rhode Island, and the Manchester Airport in Manchester, New Hampshire, to service more than merely their discrete geographic areas. These "regional reliever" airports already serve, and can provide far greater service in the future to, the Greater Boston metropolitan area. This is similar to the function that Newark Airport serves in the New York City area, and that Dulles and Baltimore-Washington Airports serve in metropolitan Washington, D.C. 98.2

Massport's failure to adequately consider administrative measures like peak-hour pricing and the potential of T.F. Green and Manchester airports is related to a larger and more serious problem: the absence of a regional strategy for dealing with Massport's ominous growth projections for Logan. Massport estimates that, whether or not the proposed runway is built, Logan's present level of 26.5 million passengers per year will grow to between 37.5 and 45 million passengers by 2010. A major regional planning initiative is needed right now -- before additional capacity is provided at Logan -- to address how to plan for this projected demand in the most efficient and environmentally sensitive way possible. 98.3

Essentially, Massport is proposing a short-term solution to a long-term problem. If the DEIS/R is accurate, then the "airside improvements" Massport proposes will simply reduce delay at Logan temporarily until the unrelenting surge in passengers using Logan and resulting airplane operations overwhelms even an expanded airport. Massport's failure to address the long term, however, does not mean that the DEIS/R adequately addresses the short-term question of delay and what alternatives exist to remedy that situation. The DEIS/R fails to address, in an effective, appropriate and sufficiently thorough manner, a number of important issues identified in the Secretary's Certificate on the ENF. Consequently, the EOEA Secretary pursuant to his authority under the Massachusetts Environmental Policy Act, as well as the Administrator of the Federal Aviation Administration (FAA) in her role as the federal official who will have to issue a record of decision for this process, should require that a *Supplemental* Draft Environmental Impact Statement/Report be prepared to deal with the issues which have not been adequately addressed in the DEIS/R. It would not be sufficient to address the deficiencies identified in the following comments, and the deficiencies identified by other commentors, in a Final EIS/R. The breadth and depth of the deficiencies are such that they require the preparation of a Supplemental DEIS/R which will *begin* to address the critical issues and concerns overlooked in the DEIS/R. 98.4

While the supplemental DEIS/R is being prepared, Massport can, in cooperation with the FAA, initiate a revised landing fee and peak period pricing pilot program. Working with the FAA to develop and implement such a pilot program would effectively insulate such a program from the legal challenges which undermined Massport's 1988 effort to reform Logan's landing fees to improve airport operations. The results of such a pilot program can be incorporated in the supplemental DEIS/R. Additionally, during this 98.5

same critical time period Massport will be able to better assess the emerging reality of high-speed rail in New England. The supplemental DEIS/R should reflect actual data, and enhanced projections based on such data, from the actual operation of Amtrak's Acela high speed rail service as well as revised data and projections concerning the use and role of the other regional airports. Finally, while the supplemental DEIS/R is being prepared, we urge Massport and other leading state officials to join with their counterparts in Rhode Island and New Hampshire, along with other interested parties throughout the region, to develop a workable, sustainable plan for inter-city travel in New England. The plan would address both the roles the different airports and rail services should be serving and how best to allow these airports to play those roles by, among other measures, fostering clean, non-automobile oriented ground transportation. 98.6

II. The alternatives analysis in Massport's DEIS/R is inadequate and requires that a Supplemental DEIS/R be prepared.

A. Massport fails to adequately assess the potential to address Logan's delay problems through better use of other airports and rail travel.

The Secretary of Environmental Affairs left no doubt in her Certificate that the "off-airport alternatives" to Logan expansion, namely better use of other airports in the region and rail travel, had to be thoroughly examined in the DEIR. Noting that this issue had "generated substantial and thoughtful commentary from many agencies, citizens, and organizations" and that she herself had "spoken at length" on the "need for an analysis of increased use both of other regional airports and intermodal transportation as viable alternatives to increased operations at Logan" in her Certificate on Massport's 1994 Generic EIR for Logan, the Secretary stated that "the Draft EIR should discuss these off-airport alternatives and analyze the potential each has to divert passengers and/or cargo from (and lower the operational impacts of) Logan Airport." (ENF Certificate, p. 3) Massport does discuss these issues, of course, but in an entirely inadequate manner.

Massport asserts that no matter what happens at other airports and on the rail system, the number of passengers demanding flights to or from Logan will rise to between 37.5 and 45 million by 2010. This is because Massport concludes that the best that can be hoped for from "regional alternatives" is a diversion of 7.5 million passengers, an amount about the size of the growth projection range. Massport essentially says that no matter what happens with other airports or rail, there still will be a delay problem. There are at least three problems with Massport's approach. First, it is entirely reactive rather than proactive; Massport does not concern itself with what significant steps it might take to boost this diversion number (although Massport's recent renewed interest in making better use of Worcester Airport is an encouraging development). A second closely related problem is Massport failure to assess, with or without such an enhanced Massport role, the potential of rail travel and other airports, most notably T.F. Green and Manchester airports, to handle more of the traffic currently being, or projected to be, handled by Logan. Third, Massport ignores the possibility that under different growth scenarios for other airports, Logan Airport's flight mix, so inefficiently burdened with small general aviation and

regional carriers, could be significantly altered so that Logan's flight operations per year could decrease enough to alleviate delays.

i. Massport's passive approach to regional alternatives.

Massport offers a disappointingly passive approach when it comes to the potential to serve travelers through facilities other than Logan. Massport suggests that the only role it can play regarding "alternative travel choices to provide relief to Logan" is to assist in their "promotion." (DEIS/R at 2-38.) As an independent quasi-public authority Massport has broad powers allowing it to engage in a wide range of activities. If, for example, Massport were to determine that entering into a Memorandum of Understanding with Amtrak under which Massport agreed to subsidize increased service to and from South Station to help reduce delay at Logan, there would be no legal impediment to the execution of such an agreement by Massport. Massport's varied aviation, maritime and development activities demonstrate the many roles that a public authority can play. Indeed, even if we were to accept the falsely limited notion of Massport's role as a "promoter" of regional alternatives, there is no analysis of the effect that different degrees and types of efforts in this area by Massport would have on use of such "alternative travel choices." What Massport should have done is present a wide range of alternatives in the DEIS/R in which enhancements, improvements and changes to a wide range of regional transportation facilities were proposed and analyzed and the role that Massport could play in facilitating these enhancements, improvements and changes was described. 98.7

ii. The emerging role of rail for travel within, as well as to and from, New England.

1. The coming of Acela: three hours door to door from Boston's Financial District to Midtown Manhattan.

Massport acknowledges that high speed rail in the Boston to New York corridor is imminent and will capture some of Logan's Boston to New York traffic. Massport relies on outdated 1994 Amtrak data for its projections, however. Since the preparation of the Final Environmental Impact Statement/Report and 4(f) Statement for Northeast Corridor Improvement Project Electrification in 1994 by the Federal Railroad Administration, more refined projections of ridership on the new high speed Acela service have been prepared and utilized by Amtrak. In the Supplemental DEIR, Massport should utilize Amtrak's most current ridership projections. Moreover, as noted above, requiring the preparation of a supplemental DEIS/R will give Massport the gift of time, time that will allow it to utilize an analysis of the *actual* operations of the new Acela High Speed Rail as well as updated projections of total ridership based on new data gleaned from actual operations in the supplemental EIS/R. 98.8

2. The T.F. Green connection: the DEIS/R ignores the critical rail developments in the Boston/Rte. 128 Station/Providence/T.F. Green segment of the Northeast Corridor.

The DEIS/R fails to mention the proposed construction of a major new intermodal transportation facility which will reshape even further our regional transportation system: the train station at T.F. Green Airport in Warwick, Rhode Island. A NEPA Environmental Assessment is being prepared for the station, and construction should be completed and the station operational by the end of 2001. The State of Rhode Island and the Commonwealth of Massachusetts have entered into an agreement regarding the extension of MBTA commuter rail to T.F. Green. CLF has learned from Amtrak's Vice President for Policy and Planning that Amtrak will stop Acela Express (high speed) trains at T.F. Green station if there is sufficient passenger demand and that all Acela Regional (conventional Amtrak service) trains are expected to stop there. He suggested that it is possible that Amtrak operations at T.F. Green may follow a pattern similar to its past operations at the Baltimore-Washington International Airport (BWI) station. When BWI Airport Rail Station opened for operations Amtrak scheduled stops at that station for approximately one-third of the trains on the corridor passing the airport. Today, only one Amtrak train traversing that corridor fails to stop at BWI Airport Rail Station, all other Amtrak trains (roughly 90% of Amtrak trips in that corridor) stop at BWI to pick up and discharge passengers.

The DEIS/R simply ignores these facts, which, in the very near future, will make it much easier for people in Boston and the southern suburbs of Boston in or near the Route 128 corridor to gain access to T.F. Green Airport in Rhode Island. As discussed above, the massive Northeast Corridor rail improvement and electrification project will speed rail travel on the existing Northeast Corridor, the passenger rail route connecting Massachusetts and Rhode Island. The agreement between the Commonwealth of Massachusetts and the State of Rhode Island to extend commuter rail service to the T.F. Green train station, coupled with Amtrak service, will provide frequent service between the T.F. Green Station and Massachusetts stations such as South Station and Back Bay Station in Boston and Route 128 Station, which sits at the intersection of the towns of Dedham, Westwood and Canton and where the MBTA is presently building a 2,670 space parking garage. This direct service might be augmented by proposed Rhode Island Department of Transportation rail shuttle service which would provide rapid and continual service between the Providence train station and T.F. Green. No attempt is made in the DEIS/R to discuss these rapidly approaching changes in the rail corridor between Boston and Rhode Island and to assess the impact that these changes will have on passenger behavior and choice and resulting demand, congestion, delay (or reductions in such factors) at T.F. Green and Logan. 98.9

3. Amtrak service to Portland: an impending reality and a service with great potential, especially when high speed rail service and possible air passenger service at Pease are considered.

Amtrak service on the Portland-Boston corridor is scheduled to commence in 1999. The Transportation Secretaries of Massachusetts, New Hampshire and Maine have jointly requested that Amtrak convert this line to high-speed service. This line passes very close

to Pease International Tradeport, an airport with tremendous unused runway capacity, and, evidently, there is a rail right of way from this corridor to Pease which could be used to easily ferry passengers from Amtrak trains to Pease.

While the DEIS/R does discuss the upcoming restoration of passenger rail service on the Portland-Boston corridor, there is no sophisticated quantitative analysis of the impact that such service would have on the regional transportation system and no mention of Pease in this context. The DEIS/R fails to present alternatives which would increase the use of this rail service so there is no study of whether such alternatives would reduce delay induced by small plane traffic between Maine communities and Logan. Additionally, the DEIS/R should have acknowledged the possible introduction of high-speed rail to this corridor and analyzed the impact that such a change would have on demand for service at Logan. 98.10

iii. The role of other airports in the regional transportation system.

The DEIS/R's analysis of the role that other airports in the region can play fails to address the possibility that travelers from within Route 495, and even in some cases within Route 128, will choose to use other airports besides Logan. The DEIS/R only examines the ability of airports like Manchester, T.F. Green and Worcester to "recapture" their local markets from Logan, overlooking the ability of these airports to attract passengers from metropolitan Boston and from the rest of the region. This deficiency ignores a phenomenon occurring at this very moment, as Southwest Airlines aggressively and successfully markets its Manchester and T.F. Green service to residents of metropolitan Boston. All the airports of New England, from Bradley which could serve as an alternative hub for major carriers to the smallest municipal airport which can provide a home for a two-seater General Aviation craft, should be integrated into such an analysis. Of course, growth at other airports would have to be carefully managed and should be integrated into the regional ground transportation network so travelers are using environmentally responsible modes for travel to and from these airports. A well managed regional transportation system may, for example, mean that a resident of Auburn would drive or take a bus to Worcester Airport (instead of the longer and more environmentally harmful drive to Logan) while a resident of Norwood might take a train to T.F. Green Airport in Rhode Island. Specific concerns, not addressed in the DEIS/R, about some of the key regional airports appear below.

1. Manchester Airport

As noted above, the ENF Certificate required that Massport look beyond its current role and examine "off-airport" measures that could be taken to address the delay problems that Massport cites in the DEIS/R. The failure of the DEIS/R to present alternatives which would encourage greater use of Manchester Airport as an alternative to Logan is a clear example of the failure of the DEIS/R to comply with these directives.

The DEIS/R does take note of the increased passenger load passing through

Manchester Airport, one of the fastest growing airports (in terms of passengers) in the nation. Inexplicably, however, the DEIS/R fails to consider that Manchester Airport may be drawing passengers from the Boston metropolitan area now and fails to project any measurable use of Manchester by travelers with trips originating within the Route 495 corridor. The supplemental DEIS/R needs to take a more sophisticated approach to its analysis of the role of Manchester- e.g., looking at current and future use of Manchester by business travelers going to and from hotels and businesses on and within Route 495 for example. 98.11

Beginning more than 10 years ago some of the more progressive regional and municipal governments in southern New Hampshire began to push for a re-introduction of passenger rail service into that area. Recently, the New Hampshire Department of Transportation requested that the MBTA extend its commuter rail service into New Hampshire to effect such a restoration, opening a dialogue between those agencies that is still in progress. At least one possible route for rail service into New Hampshire would allow for direct service to Manchester Airport. The supplemental EIS/R should include an analysis of the opportunity for rail service to Manchester Airport, including what Massport and its sister agencies can do to bring this about, and an analysis of the likely impact of this service on airport passenger demand. 98.12

2. T.F. Green Airport

T.F. Green Airport in Warwick, Rhode Island presents an only partly realized opportunity for our regional transportation system. It can do far more than "recapture" its local market from Logan- the role assigned it by the DEIS/R, and with proper non-automotive ground transportation links it can do so in a very environmentally responsible fashion. The failure of the DEIS/R to adequate account for the current trips by Boston area travelers who travel by air from T.F. Green in order to make use of Southwest Airlines' discounted service is a significant deficiency. The failure of the DEIS/R to factor in future use of T.F. Green by the residents of Greater Boston is an unfortunate logical extension of that first failure. Compounding these mistakes is the total failure of the DEIS/R to consider the changes in the regional rail system which will make travel to T.F. Green from Boston and along the rail corridor between Boston and Providence much easier. These changes are discussed at length above and must be factored into any analysis of the role that T.F. Green can play in the regional transportation system in general and in relief of Logan in particular. 98.13

3. Worcester Airport

The supplemental DEIS/R must contain a thorough examination of the facilities and potential of Worcester Municipal Airport. The new arrangement under which Massport will operate that airport will facilitate an active Massport role in fostering and building that airport. Alternatives for enhanced ground transportation facilities to and from Worcester Airport, including rail and shuttle bus should be developed, analyzed and presented in the supplemental DEIS/R, along with possible future passenger and operations 98.14

projections for the Worcester Airport, so the impact they will have on operations at Logan, as well as the environmental impacts of such changes, can be fully understood and considered.

4. Hanscom Field

The DEIS/R fails to fully propose, develop and analyze potential roles that the Massport operated civilian facility at Hanscom Field could play in the regional transportation system. At the very least, alternatives that provide for increased use of Hanscom for General Aviation (GA) use should be developed and analyzed. One possible model for use of Hanscom could be the role that Teterboro Airport in New Jersey plays in the New York metropolitan area. That airport does not have any significant passenger terminal facilities but has successfully shouldered the GA and helicopter load for New York City, moving this smaller air traffic out of the "stream" competing for landing and takeoff space at the three major airports operated by the Port Authority of New York and New Jersey. Measures that would discourage the airplanes responsible for the 25,000 annual GA operations that the DEIS/R forecasts for the foreseeable future from using Logan should be studied in tandem with measures that would encourage such planes to land at Hanscom or other "reliever" airports outside of Boston, ranging from the regional airports discussed above to the small GA only airports throughout the region. 98.15

iv. Massport fails to adequately assess the potential for other airports in the region and rail to receive a significant enough portion of Logan's air traffic – particularly small carriers – to improve Logan's delay problem and dispense with the new runway proposal.

Massport claims that proposed Runway 14/32 is needed to deal with the problem of northwest or southeast winds currently hampering operations by forcing Logan to use two rather than three runways, thereby reducing the operations per hour rate by 25%, from 120 to 90.[1] Massport's view is that the new runway will permit Logan to function more often at its maximum capacity of 120 operations per hour, thereby reducing delay. Massport does not even pay lip service to the important possibility of solving this same delay problem by another means: diverting a sufficient percentage of Logan's flight operations to other airports and rail so as to reduce Logan's operations per hour to 90. Under this scenario, with the exception of about 10 days a year, the northwest/southeast wind problem disappears -- *without having to build a new runway* -- because with these wind conditions Logan can handle up to 90 operations per hour. Particularly if the bulk of the diverted flights were small planes – see discussion below on peak period pricing and other runway pricing reforms – Logan's efficiency would improve, as operating small planes on the same runways/flight paths as large planes causes additional delays (small planes need to be spaced further from large planes because they can have difficulty flying in the "wake" of large planes). 98.16

[1] Massport asserts that approximately 10 days a year Logan experiences severe northwest winds that forces it to operate just one runway, which limits it to 60 flight operations per hour.

B. Massport fails to adequately assess the potential to address Logan's delay problems through peak period pricing or other runway fee reforms.

A central mandate of the ENF Certificate, which Massport voluntary agreed to undertake, was an analysis of peak period pricing and other administrative measures designed to alter the mix and timing of airplane operations in and out of Logan in order to better manage the Airport and reduce delay. That this would be a critical element of the DEIS/R inquiry makes considerable sense when Logan's flight mix is considered. Approximately 90% of Logan's passengers are accommodated on about half of the flights in and out of the airport. The other half of the flights carry the remaining 10% of the passengers. This is a highly inefficient use of limited runway space, and, it is our understanding, is atypical for major American airports. The notion of imposing a pricing mechanism that would discourage small planes in the peak hours, and/or that would lead to some trip consolidation so that the total number of small plane operations decreased, while still insuring that essential service to other cities in the region continued, has significant appeal.

Massport, unfortunately, has not presented a credible analysis of peak period pricing (and does not address any other possible runway pricing reforms). Rather than setting out to figure out what it would take in the way of peak hour pricing or other runway pricing reforms to achieve significant delay reduction benefits at Logan, Massport instead sets out to answer the question: "What effect would a very low peak hour fee ($150 per flight) have on operations and delay at Logan?" Just as discouraging is the limited analysis given this watered down version of peak period pricing. 98.17

There are only a few select sources of data on the effect that administrative delay reduction/capacity management programs like non-weight based landing fees peak period pricing will have on actual operations at an airport. Limited efforts in the New York metropolitan area can be analyzed. Previous experiments overseas, like the Sydney (Australia) effort referenced by the U.S. Environmental Protection Agency (EPA) in its comments on the NEPA scope, can be considered. The actual operation of the withdrawn Program for Airport Capacity Efficiency program (PACE) at Logan, discussed below, can be considered and re-evaluated in light of applicable federal law and regulations. None of these data are considered in the DEIS/R.

Massport's analysis applies a blunt single price formula to current operations and assumes that air carriers will react in simplistic ways- either by canceling flights or moving a few "shoulder" flights out of the peak period window. Other potential responses of carriers to such a scheme, including using larger aircraft for fewer flights, are ignored. As a result, Massport never even considers the possibility that a runway pricing system could be imposed that materially alters the flight mix at Logan so that a significant number of small flights are diverted elsewhere, canceled, or consolidated into fewer larger plane flights. Were this to happen such that total operations per hour were markedly reduced, runway pricing reform could meaningfully aid with the northwest/southeast wind delay

problem Massport describes.

i. Massport should look to its own experience for evidence of the salutary effects that revised landing fees and peak period pricing can have on airport operations.

In December 1987, Massport introduced its Program for Airport Capacity Efficiency (PACE). The purpose of PACE was to eliminate a *de facto* subsidy for small aircraft operations and reduce airport congestion. To achieve these ends, PACE included both a restructured landing fee and "peak-hour pricing", an additional fee for landing during congested rush hour periods. The new landing fee went into effect on July 1, 1988 and was used until December 22, 1988 when the U.S. Secretary of Transportation ruled that the restructured landing fee had not been calculated properly and that the exception in the program designed to protect smaller regional airports did not apply to enough such airports. This ruling was upheld (and a court decision in favor of the restructured landing fee was reversed) in New England Legal Foundation. v. Massachusetts Port Authority, 883 F.2d 157 (1st Cir. 1989). The peak-hour pricing portion of PACE was never instituted.

In February 1989 -- two months after the PACE landing fee was discontinued -- Massport issued a summary[2] of the PACE fee's remarkably favorable impact on Logan's operations:

> 1. On-time performance at Logan was significantly improved. Not only did the percentage of on-time departures increase markedly, but Logan's relative on-time performance rose steadily in comparison to the performance of other busy airports around the country. In September of 1987, when DOT started issuing "report cards" grading on-time performance at the nation's 27 busiest airports, Logan ranked 21st. In September of 1988, [Logan] had moved up to 12th; in October, [Logan was] 11th; in November [Logan] ranked 10th; and, by the end of December, when DOT ruled against PACE, [Logan] had achieved the astonishing rank of 2nd-best in the nation for on-time performance.
>
> 2. Commuter carriers carried slightly more passengers in slightly fewer flights on significantly larger airplanes. This action spread the cost of landing fees over more seats per trip, and reduced the number of flights on heavily traveled routes, thus improving the efficiency with which the commuter carriers used Logan's finite and valuable airfield capacity. Some carriers increased their fares in response to the new fees, but the fare increases did not slow the growth of ridership.
>
> 3. Thanks in part to Massport's "Essential Air Service" Exemption Program, smaller commuter markets suffered no adverse consequences from the higher landing fees

[2] PACE Update, February, 1989 by Thomas P. Champion, Assistant to the Executive Director, Massport (*hereinafter* "PACE Update").

4. General aviation (GA) traffic at Logan declined by about one-third, but did not disappear. Since the per-hour cost of operating business jets and turbo-props has always been high, the PACE landing fee had no effect on this segment of the GA population at Logan, which continued to use the airfield with its accustomed frequency. Smaller, single engine aircraft did make less frequent use of Logan, although this change did not result in the "diversion" of traffic to Hanscom Field. Since travelers who used these small aircraft tended to be traveling within a 150-mile radius of Logan, and since most of them were using private planes to move to and from markets which were also served by served by scheduled commercial service, Massport staff correctly predicted that the users of these smaller planes simply switched over to scheduled air service or to some other mode of transportation. Perhaps the most interesting GA statistic is that *more than half of the private aircraft using Logan during the PACE fee period were traveling to or from points which offered scheduled air service.* In other words, general aviation is demonstrably more a tool of convenience and luxury than of necessity.

(PACE Update; p. 3.) Both the Secretary of Transportation and the First Circuit stated in their decisions concerning PACE that a program with the substantive effects of the PACE program could be successfully implemented by Massport, if it was developed and implemented correctly.

In 1993, Massport made a well-reasoned presentation of a revised program that was designed to conform with federal law as articulated by the Secretary of Transportation and the First Circuit. This presentation described a specific peak-hour pricing proposal and showed that, if this proposal was implemented, it would reduce peak-hour flights by 10-17.5 percent. (Massachusetts Port Authority, "Logan Airport Peak Hour Pricing" (Apr. 1993) (Attachment 1); Arthur D. Little, Inc., for the Massachusetts Aeronautics Commission. "Strategic Assessment Report -- Final Report," p. 4-42 (July 1993).)

Like PACE this program moved Logan away from a traditional landing fee based solely on the weight of a plane and levied landing fees based partly on the weight of the plane and partly on an operations charge based on the type of plane with an additional peak period fee for peak period landings and take-offs. Massport withdrew this proposal prior to implementation.

It is important to recognize that peak-hour pricing affects congestion levels primarily by causing modest shifts in departure times and types of aircraft used, not by dampening passenger activity. According to Massport, a reduction in peak-hour congestion would "come mainly from a reduction in commuter [flight] activity during peak hours, especially in markets with ready commuting alternatives." (Massport, "Logan Airport Peak Hour Pricing.") Massport "does not expect that any of the commuting markets served by Logan Airport would suffer a significant reduction in access to the airport." (Id.) Roughly one-third of the reduction in peak-hour flight activity would result from a rescheduling to off-peak hours. (Id.) Peak-hour pricing is projected not only to

result in a substantial reduction in delays at Logan, but to reduce average costs per operation for flights with about 110 passengers or more. (Id.)

From passengers' point of view, the perceptible effect of peak-hour pricing would be a substantial reduction in delays. "During peak periods, Massport would expect a 5% reduction in the use of the airfield to cause at least a 20% drop in average expected flight delays." (Id.) Since Massport expected that peak-hour pricing would result in a 10-17.5 percent reduction in peak-hour flights, travelers would thus experience a 40 to 70 percent reduction in delays.

Passengers would not experience a noticeable reduction in service. Massport calculated the estimated impact on the number of peak-hour weekday seats available on flights between Logan and 49 airports in the eastern United States and Canada. Overall, only 3 percent of peak-hour seats (not all seats) in those markets would be canceled. (Massport, "Logan Airport Peak Hour Pricing Plan.")[3] Three-quarters of those markets would experience the cancellation of 3 percent or less of peak-hour seats, and 22 of them would experience the cancellation of no peak-hour seats at all. (Id.) Ticket prices for the 49 markets would increase a mere 1 percent (id.) -- a price well worth paying for the substantial reduction in delays, and the avoided taxpayer outlays and environmental impacts that building new runway capacity would entail.[4]

The benefits of peak-hour runway pricing would therefore be substantial and widely shared. Travelers would benefit from lower costs, reduced delays, and the use of larger, safer, more comfortable aircraft. Communities around Logan Airport, Hanscom Field and other existing or potential airports would avoid airport expansion undertaken to accommodate the inefficiencies of heavy reliance on small aircraft. Such communities all share a strong interest in the adoption of peak hour pricing at Logan Airport. The Commonwealth as a whole would benefit from avoiding the potentially huge capital and operating costs of accommodating a continuation or growth of existing inefficiencies. The

[3] The reduction in the number of peak-hour flights in the 49 regional markets was estimated to be 7 percent -- more than double the estimated reduction in the number of peak-hour seats, which is as it should be. It should be noted that two markets in which Massport predicted the most flights would be canceled -- Boston-Portland and Boston-Bangor, which would lose 21 percent and 15 percent of peak period weekday flights, respectively -- both experienced an explosion in the number of daily flights during the early 1990s recession: Boston-Portland daily departures grew by 121 percent in 1988-1993, and Boston-Bangor daily departures grew by 92 percent in that period. (Massport, "Logan Airport Peak Hour Pricing Plan.") With peak-hour pricing, Portland would still have twice as many flights as it did in 1988, and Bangor would have roughly one and three-quarters as many flights as it did then. (Id.) The two markets would have only 9 and 14 percent fewer peak-hour seats, respectively, than in 1993 (id.), and about the same number of daily seats.

[4] A few regional airports served by flights to and from Logan do not have runways that can accommodate jets. It is CLF's understanding, however, that all or virtually all the airports which Massport predicted would have fewer weekday peak-period flights to and from Logan can accommodate jets. One airport with a notable lack of jet capacity is the Provincetown Airport -- which Massport predicted would experience no decrease in weekday peak period flights or seats, and where the impact of peak hour pricing would be reflected solely in a fare increase of 12 percent. (Massport, "Logan Airport Peak Hour Pricing Plan.")

region and nation would benefit from more energy-efficient flight operations.

It is not surprising that the national jury of experts who heard testimony at "The Boston Conference" in 1994 included peak-hour runway pricing at Logan Airport in the recommendations it issued. The jury wrote:

> [T]he Commonwealth should adopt "congestion pricing" (charging landing fees that increase at peak travel times) to mitigate bottlenecks and delays at Logan that would impede the region's future economic growth. The Jury believes that this approach offers a relatively inexpensive and flexible demand management strategy, prolonging the use of Logan at its present location without requiring controversial runway expansion.

(Harvey M. Gantt, et al., "The Boston Conference Final Report: National Jury Recommendations," pp. 4-5 (Aug. 24, 1994).)

No justification is given in the DEIS/R for the failure to propose and study an alternative applying a more complex pricing mechanism, like that presented by Massport in 1993 or discussed by the Boston Conference, augmented by a range of peak hour fees (as contemplated by the 1993 proposal). Such an alternative should be a prominent feature of the supplemental DEIS/R. 98.18

Discussion and study of such an alternative must include an examination of varying levels of peak period fees. Additionally, such an analysis should not restrict itself to an assumption that significant delay reductions through runway pricing reform occur only when the airlines "overschedule" and attempt to have more than 120 operations per hour occur at Logan. As noted above, Massport should be directed in the supplemental DEIS/R to consider what it would take in the way of peak period pricing or other runway pricing reforms to bring Logan's operations per hour number closer to 90, thereby largely obviating the supposed need for an additional runway. A full range of possible carrier reactions should be considered, such as moving to larger planes or the consolidation of existing companies providing service to smaller airports.

ii. The Federal program to maintain air service to isolated smaller airports, a Massport version of such a program, or a joint Federal/Massport implementation of this program may reduce or eliminate Massport's "market access" concerns regarding smaller airports.

The federal Essential Air Service (EAS) program is intended to ensure that communities with relatively low commercial airplane traffic do not lose service entirely, it is deeply disturbing that the DEIS/R does not examine the mitigating effect that this program might have on Massport's concerns regarding reduction in service to certain outlying communities. The U.S. Department of Transportation ("DOT") administers the EAS program by determining the minimum level of service required at each eligible

community. DOT specifies a hub through which the community is linked to the national network, a minimum number of round trips and available seats that must be provided to that hub, certain characteristics of the aircraft to be used, and the maximum permissible number of intermediate stops to the hub. Where necessary, DOT subsidizes a carrier to ensure that the specified level of service is provided.

A review of the DOT website indicates that EAS is subsidizing air service from Logan to: Augusta/Waterville, ME; Bar Harbor, ME; Rockland, ME; Rutland, VT; and Keene, NH. Additionally, that website indicates that the following destinations from Logan have been deemed eligible for EAS subsidies: Bridgeport, CT; New Haven, CT; Bangor, ME; Portland, ME; Presque Isle/Houlton, ME; Hyannis, MA; Martha's Vineyard, MA; Nantucket, MA; Laconia, NH; Lebanon, NH/White River, VT; and Manchester/Concord, NH. More details about the federal EAS program may be found at on DOT's website at http://ostpxweb.dot.gov/aviation/rural/ruralair.htm.

There are three ways Massport can pursue an EAS subsidy for service to given community. First, it may try to initiate DOT review of a community which is not currently eligible for an EAS subsidized carrier (assuming that no carrier or only one carrier currently provides service to that community). (See 14 C.F.R. § 325.10.) Second, Massport may submit a proposal to DOT for "Enhanced Essential Air Service." Under an Enhanced "EAS" program, either a) Massport would provide 50% of the subsidy for the proposed service (and DOT would provide the other 50%) or b) DOT would pay 100% of the subsidy but review the proposal for success after 2 years. Finally, Massport could implement its own EAS program which mirrors (or closely follows - subject to DOT's approval) DOT's program. (*See* New England Legal Foundation v. Mass. Port Authority, 883 F.2d 157 (1st Cir. 1989)). If it chose to create its own EAS program without developing it jointly with FAA, Massport would have to pay the subsidy itself either by cash payment or by special adjustment to landing fees.[5]

The full analysis of revised landing fees and peak period pricing in the supplemental DEIS/R must include a thorough discussion and review of the Federal EAS program and how it would eliminate, reduce or mitigate the negative effects on air service to outlying communities. 98.19

iii. The "Case Studies" appended to the DEIS/R fail to prove that a sophisticated and properly developed and implemented reform of landing fees and/or peak period pricing scheme would harm the Cape and Islands.

The "Regional Carrier Case Study" and "Cape Cod [& Islands] Case Study" in Appendices F and G of the DEIS/R are a cursory review of the economic development strategy of that part of Massachusetts and the role that air travel plays in that strategy and a

[5] The Massport EAS program was struck down in part because it did not include as many communities as the federal version.

very simple analysis of the possible impact that the simplified peak period pricing scheme discussed in the DEIS/R might have on that service. No attempt is made in these appendices, or elsewhere in the DEIS/R, to consider other alternatives which might satisfy the transportation needs of these communities. We cannot know if high speed ferry service, enhanced bus service or rejuvenated rail service (or some combination of these or other options) could compensate for any adverse effect on air service brought about by runway pricing reforms - this analysis is simply not present in the DEIS/R. 98.20

Additionally, the analysis in these appendices fails to take into account the possibility that any landing fee reform program and/or peak period pricing scheme would include an essential air service exception to ensure there would be adequate basic service to regional airports. It also fails to consider the potential palliative effect of the federal Essential Air Service (EAS) program discussed above.

III. The capacity increasing potential of proposed Runway 14/32 should be studied and the environmental impacts of the capacity increase assessed.

Massport states that proposed Runway 14/32 would not result in any additional capacity at Logan since it would not allow Logan to exceed its current ceiling of 120 flight operations per hour in any given hour. But the new runway would allow Logan to handle 120 flights per hour *more of the time*, which, when Massport's ominous growth projections for Logan are considered, surely would result in more passengers and flights at Logan with the runway than without. According to Massport's projections, the delay hours are to mount at Logan with or without the new runway, but Massport contends that the delays will be considerably worse without the new runway. Really dreadful delays would presumably influence air carrier business decisions and passenger travel decisions such that Logan without the new runway would handle fewer flights and passengers than Logan with the new runway. The extent of this proposed increase in capacity must be studied and its environmental impacts, both airside and groundside, analyzed. 98.21

IV. Technological advances and changes which could change airport operations should be studied in the supplemental DEIS/R.

A conversation with a former Chairman of the Massport Board of Directors with over 30 years of experience in the operations and planning of airports yielded the observation that in the late 1960's and early 1970's (when Runway 14/32 was first proposed) there was a general belief that there would be a surge in the number of travelers traveling by air during the next 30 years and that this required a large scale program of building runways at existing airports to handle this increase. Of course, half of this prediction was completely accurate. Far more people travel far more miles by air today than in 1969. However, advances in technology- notably the proliferation of larger aircraft and advances in electronics (and in particular avionics) have enabled many of the airports that were in use at that time to handle the increased traffic without significant additional runway space.

It is reasonable to ask if history might repeat itself? Could advances in technology significantly reduce delay at Logan and other airports- not just in good weather but in bad as well? Is there current or anticipated technology that should be studied as an alternative to some or all of the airside improvements proposed by Massport? Massport summarily states that delays "caused by most weather conditions cannot be eliminated." (DEIS/R p. 1-3.) Are the prospects for technological advances to facilitate airport operations in adverse weather conditions really this bleak? Perhaps so, but we simply do not know based on the DEIS/R. Doing this analysis may require a more sophisticated presentation of the causes of delay at Logan. For example, how much delay is due to fog reducing visibility, how much is due to snow buildup on runways? This is precisely the type of alternative which should have been the subject of analysis in the DEIS/R and its absence is yet another reason why a supplemental DEIS/R is required. 98.22

V. The DEIS/R does not adequately address the Environmental Justice questions critical to both federal and Massachusetts environmental review

Executive Order 12,898, entitled "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," requires each federal agency to identify and address environmental and health effects of its activities that particularly burden minority and low income communities. (Exec. Order No. 12,898, § 1-101, 59 Fed. Reg. 7,629 (1994).) A purpose of the executive order is to "reinforce" agencies' obligations under NEPA and Title VI of the Civil Rights Act of 1964. (See 62 Fed. Reg. 18,378 (1997).) The executive order, like NEPA and MEPA, is intended to force agencies to improve their decisionmaking processes. It focuses on both minority and low-income communities, whereas Title VI applies only to discrimination based on race, color, or national origin and does not directly address poverty issues. (See President Clinton, Memorandum for the Heads of all Departments and Agencies (Feb. 11, 1994).) To achieve its goals, the executive order relies on existing environmental and civil rights laws, particularly NEPA and Title VI.

In response to the executive order, the U.S. Department of Transportation has prepared an environmental justice strategy (60 Fed. Reg. 33,896 (1995)) and issued an Order on Environmental Justice. (62 Fed. Reg. 18,377 (1997).) Like the executive order, the DOT Order draws on existing laws, "primarily NEPA [and] Title VI of the Civil Rights Act of 1964." (62 Fed. Reg. 18,378 (1997).) The DOT Order "is intended to insure that a process for the assessment of environmental justice factors becomes common practice in the application of [NEPA, Title VI] and related[] statutes." (Id.) Incorporation of environmental justice principles in all DOT activities is to be accomplished, by "fully considering [those] principles throughout planning and decision-making processes in the development of programs, policies, and activities, using the principles of the National Environmental Policy Act." (Id. at 18,379.)

The DOT Order provides that NEPA and other statutes will be administered so as to identify, early in the development of an activity, the risk of discriminatory impacts so that appropriate action can be taken. (Id. at 18,380.) In implementing NEPA, "where

relevant, appropriate and practical," DOT agencies are to obtain information about the population served and/or affected by race, color, national origin, and income, along with information about steps to guard against disproportionately high adverse impacts. Id. "[D]isproportionately high and adverse impacts on minority populations and low-income populations" are to be avoided by, inter alia, proposing measures to avoid, minimize, and/or mitigate such impacts; providing offsetting benefits and opportunities to enhance communities, neighborhoods, and individuals affected by the activities involved; considering alternatives that would avoid or minimize such impacts; and eliciting public involvement and "soliciting input from affected minority and low-income populations in considering alternatives." (Id.) An activity that will have a disproportionately adverse effect on minority or low-income populations is to be carried out "only if further mitigation measures or alternatives that would avoid or reduce the disproportionately high and adverse effect are not practicable." (62 Fed. Reg. 18,380.) DOT's findings and analysis made in fulfillment of these requirements "must be appropriately documented, normally in the environmental impact statement or other NEPA document." (Id.)

Federal agencies are required to comply with executive orders and with their own regulations and guidelines and DOT states in its order that "[c]ompliance with Executive Order 12,898 is an ongoing responsibility." (62 Fed. Reg. 18,379 (1997); see also Delaney v. EPA, 898 F.2d 687, 693 (9th Cir. 1990) (agency must adhere to own guidelines); Steven Ostrow, Note, Enforcing Executive Orders: Judicial Review of Agency Action Under the Administrative Procedure Act, 55 Geo. Wash. L. Rev. 659 (1987).)

The absence of any substantive environmental justice analysis in the DEIS/R even remotely meeting the requirements of the executive order and the DOT Order is especially shocking considering the location of the project: in East Boston, a community where, as of 1990, 18 percent of the residents were of Hispanic origin, 13 percent were members of non-white minorities, and 18 percent were white people with incomes below the poverty level. (See U.S. Department of Commerce, Bureau of the Census, "1990 Census of Population and Housing," Summary Tape Files 1, 3.) The Asian-American and Hispanic groups in the East Boston community is believed to have grown since 1990 and the impacts of this project on those communities, as well as the minority and low-income communities in Logan's flight path, should have been considered for the purposes of both NEPA and MEPA review. 98.23

While the environmental justice issues and analysis raised by the executive order and DOT Order, and which underpin EPA's extensive comments on this subject, are derived from Federal law, policy and orders the principles, information and analysis on which EPA relies on fully applicable to the MEPA process and provide further reason to conclude that the DEIS/R is inadequate. The Secretary of Environmental Affairs has the statutory and regulatory tools and the ability to address the critical environmental justice raised by EPA and ignored by Massport. The MEPA process can play a pivotal role by ensuring that minority and low income communities do not shoulder a disproportionate share of the environmental effects of projects such as the one under consideration here.

VI. Additional environmental concerns not adequately addressed in the DEIS/R

The discussion of impacts of the proposed airside improvements on the Boston Harbor Islands is facially inadequate. The effort to use the provision in the Boston Harbor Islands National Recreational Area statute (16 U.S.C. § 460kkk) which states that Logan air traffic passing overhead is not "constructive use" of the park National Recreational Area as a general NEPA and MEPA waiver is plainly improper. These provision simply means that overflights of the Islands cannot be deemed "use" of the Islands for purposes of Section 4(f). It has no effect on the requirement of NEPA and MEPA that all alternatives be analyzed to determine their full noise and visual effects on humans camping on the Harbor Islands and in boats in the vicinity of the Islands, as well as on all animals in and around the Islands. 98.24

The discussion of the Upland Sandpipers who currently nest in the path of the proposed Centerfield Taxiway references the mitigation plan which has been developed by Massport, in consultation with the Massachusetts Heritage & Endangered Species Program. This plan may be adequate but it should be fully aired prior to its inclusion in a Final EIR/S. Moreover, no case has been made yet in any environmental review document that all efforts have been made and exhausted to avoid or reduce impact on this State listed species and that mitigation by creating new habitat far from this site which will benefit other members of this species is the appropriate course. 98.25

The air quality analysis in the DEIS/R has serious deficiencies, as demonstrated by the comments of Dr. Henry S. Cole. As Dr. Cole observes, the total absence of an analysis of the air quality effects of particulate matter with a diameter of less than 2.5 microns (PM 2.5) from aircraft, increased motor vehicle emissions and emissions outside of Route 128 or with an altitude greater than 3,000 feet are all glaring omissions. Moreover, Dr. Cole makes important observations about the potential air quality effects of the unchecked growth with is assumed in the EIS/R as well as the potential unstudied health hazards which may be present in the vicinity of Logan at this moment. A supplemental EIS/R is needed to lay out alternatives which are intended to address these concerns and to analyze the effects that all alternatives may have on air quality, both in the immediate vicinity of Logan and throughout the region. Such studies should also look at the cumulative effect of large amount of emissions occurring at peak air travel hours and determine if a peak period pricing scheme could have a positive impact on air quality by dispersing NO_x and other emissions more evenly of the course of the day. 98.26

VI. Conclusion

For the foregoing reasons, Massport has failed to make its case that it needs Runway 14/32. The alternatives analyses, both with regard to peak hour pricing/runway pricing reform and the role of other regional airports and rail, as discussed at length above, need serious additional work. Accordingly, a Supplemental Draft Environmental Impact Statement/Report is warranted. The time necessary to do a credible job on the SDEIS/R may permit Massport to analyze actual data from the forthcoming Acela high-speed rail 98.27

service and collaborate with the FAA on a peak period pricing/runway pricing reform experiment. Finally, we strongly urge that, in conjunction with the thorough alternatives analyses necessary for the runway proposal, Massport leadership and other appropriate Massachusetts state officials join with their counterparts in Rhode Island and New Hampshire, along with other interested parties throughout the region, to develop a workable, sustainable plan for inter-city travel in New England. The plan would address both what roles the different airports and rail services should be serving as well as how to achieve these results.

Letter 98
Conservation Law Foundation

Code	Topic 1	Topic 2	Comment	Response
98.1	Alternatives	Peak Hour Pricing	... fails to adequately assess the potential to reduce delays ... by implementing "peak-hour pricing,"...	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5.4 of the Supplemental DEIS/FEIR.
98.2	Regional Transportation	Regional Airports	Massport fails to consider the potential for T.F. Green Airport ...and the Manchester Airport ...to service more than merely their discrete geographic areas.	The regional airport diversion analysis presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR was based on objective service area assumptions. Each service area was defined solely by driving time criteria. In other words, each regional airport's service area consists of cities and towns for which it is the closest airport, regardless of the availability of more extensive services and/or lower airfares at more distant, but larger airports such as Logan Airport. Thus, the service areas for T.F. Green/Providence and Manchester airports extended into portions of northern and southeastern Massachusetts; areas normally considered part of Logan Airport's primary market area.

Code	Topic 1	Topic 2	Comment	Response
98.3	Regional Transportation	Regional Airports	A major regional planning initiative is needed right now ...	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. One of the issues that the FAA directed the group to discuss is the inclusion of additional data related to regional transportation alternatives in the Supplemental DEIS/FEIR. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies form the basis of a comprehensive regional transportation strategy that includes the Airside Project at Logan Airport, expansion and growth of the regional airports, and the implementation of high-speed rail and other regional rail projects. All these measures are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. By the end of 2000, Boston residents had several alternatives to Logan Airport including Worcester Regional Airport, Manchester Airport, T.F. Green/Providence Airport, Pease International Tradeport, and Amtrak's high-speed Acela train service. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of options to Logan Airport. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its assumption of operating responsibility for the Worcester Regional Airport in January 2000 and its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of Massport's initiatives in support of regional transportation alternatives.

Code	Topic 1	Topic 2	Comment	Response
98.4	Environmental Review Process	MEPA	The breadth and depth of the deficiencies are such that they require the preparation of a Supplemental DEIS/R ...	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
98.5	Alternatives	Peak Pricing Program	Suggest immediate implementation of a pilot peak period pricing program.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5.4 of the Supplemental DEIS/FEIR.
98.6	Regional Transportation	Passenger Rail	Request emerging reality of high-speed rail be assessed.	The analysis of regional alternatives presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR relies on air to high-speed rail diversion estimates published in the Supplemental DEIS/FEIR and Section 4(f) Statement, Northeast Corridor Improvement Project, prepared by the Federal Rail Administration in October 1994. In preparing the Supplemental DEIS/FEIR, Massport contacted Amtrak for more recent estimates, but Amtrak did not have any updated ridership estimates that could be released to Massport. Amtrak's written response to Massport's request for updated ridership numbers is contained in Appendix B of the Supplemental DEIS/FEIR.
98.7	Regional Transportation	Passenger Rail	[Request that Massport] present a wide range of alternatives...in which enhancements, improvements and changes to a wide range of regional transportation facilities were proposed and analyzed and the role that Massport could play in facilitating these enhancements...	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market.
98.8	Regional Transportation	Passenger Rail	Incorporate more current Amtrak projections in analysis.	Refer to response to Comment 98.6.
98.9	Regional Transportation	Passenger Rail	Provide rail discussion/analysis that includes new T.F. Green Airport and Route 128 Stations.	Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of the Warwick train station and people mover connection to T.F. Green/Providence Airport.

Code	Topic 1	Topic 2	Comment	Response
98.10	Regional Transportation	Passenger Rail	Provide detailed quantitative analysis that the restoration of passenger rail service would have on Portland-Boston corridor including potential connection to Pease.	The restoration of Portland-Boston rail service was analyzed in the Draft EIS/EIR. According to the Portland Rail study, more than 99 percent of travel in the Portland-Boston corridor is by automobile. The same study estimated that restoration of the rail service would have no impact on the amount of travelers using air because the rail travel time is not competitive with the air mode. Additionally, the air market is estimated at only 100,000 annual passengers. This is less than one-half of a percent of Logan Airport's total passenger traffic in 1999. Refer to Section 2.4 of the Draft EIS/EIR.
98.11	Regional Transportation	Regional Airports	...needs to take a more sophisticated approach to...looking at current and future use of Manchester by business travelers going to and from hotels and businesses on and within Route 495 ...	Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of air service development at the Manchester Airport and Logan Airport passenger diversion to the Manchester Airport.
98.12	Regional Transportation	Passenger Rail	... should include an analysis of the opportunity for rail service to Manchester Airport, ...	Refer to Section 2.9 of the Supplemental DEIS/FEIR for a description of all ground access improvement projects at the regional airports that are currently in the environmental planning or construction phases.
98.13	Regional Transportation	Regional Airports	[Does not adequately] account for the current trips by Boston area travelers who travel by air from T.F. Green ... [or] ... to factor in future use of T.F. Green by the residents of Greater Boston ...	The T.F. Green/Providence and Manchester airports have experienced significant traffic growth over the last several years as a result of new low-fare, jet airline services to short-and medium-haul destinations. The emerging role of these airports in serving the region's demand is documented in Sections 2.3 and 2.4 of the Supplemental DEIS/FEIR.
98.14	Regional Transportation	Regional Airports	... must contain a thorough examination of the facilities and potential of Worcester Municipal Airport.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Airside Project Draft EIS/EIR for these improvements. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other alternative regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Section 2.2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.

Code	Topic 1	Topic 2	Comment	Response
98.15	Regional Transportation	Regional Airports	... alternatives that provide for increased use of Hanscom for General Aviation (GA) use should be developed and analyzed.	Refer to Section 2.6 of the Supplemental DEIS/FEIR for a description of Hanscom Airfield's role as a general aviation reliever airport for Logan Airport. Hanscom Airfield currently has six times the general aviation activity of Logan Airport. General aviation users of Logan Airport must pay a landing fee, while there is no landing fee charge at Hanscom Airfield for general aviation users.
98.16	Regional Transportation	Regional Airports	Massport does not even pay lip service to the important possibility of solving this same delay problem by another means: diverting a sufficient percentage of Logan's flight operations to other airports and rail so as to reduce Logan's operations per hour to 90.	Refer to response to Comment 98.2, the regional diversion analysis presented in Chapter 2 of the Draft EIS/EIR, and the PPP case studies in Appendices F and G of the Draft EIS/EIR.
98.17	Alternatives	Peak Period Pricing	... has not presented a credible analysis of peak period pricing ...	Refer to response to Comment 98.1.
98.18	Alternatives	Peak Period Pricing	No justification is given ... for the failure to propose and study an alternative applying a more complex pricing mechanism, ...	Refer to response to Comment 98.1.
98.19	Alternatives	Peak Period Pricing	The full analysis of revised landing fees and peak period pricing ... must include a thorough discussion and review of the Federal EAS [Essential Air Service] program ...	The PPP exemption analysis in the Supplemental DEIS/FEIR responds to the directives of the EOEA Secretary in his certificate on the Draft EIR. A discussion of Massport's proposed PPP Exemption Program, which covers all EAS eligible communities in New England with a Boston service designation, is discussed in Section 4.5.3 of the Supplemental DEIS/FEIR.
98.20	Alternatives	Peak Period Pricing	No attempt is made ... to consider other alternatives which might satisfy the transportation needs of these [Cape Cod] communities [if peak period pricing were implemented].	Refer to Section 4.5.3 of the Supplemental DEIS/FEIR, which includes an analysis of a PPP exemption program for small air service communities. The analysis shows that the carefully crafted exemption program maintains service to small communities without diluting the overall delay reduction benefits of the PPP option.
98.21	Alternatives	Runway 14/32	... the new runway would allow Logan to handle 120 flights per hour *more of the time,* ... The extent of this proposed increase in capacity must be studied and its environmental impacts, both airside and groundside, analyzed.	Logan Airport's normal airfield capacity is approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. Refer to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of the operational benefits of the Preferred Alternative and to Chapter 6 of the Supplemental DEIS/FEIR for a discussion of environmental impacts of Preferred Alternative.
98.22	Analysis Assumptions/ Methodologies	Delay Model	[Request] a more sophisticated presentation of the causes of delay at Logan.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion by addressing constraints at Logan Airport. Delays caused by conditions at other airports or other factors, such as mechanical failure, are not addressed since Massport cannot influence these delays. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT measures of delay and historical data, along with comparisons of Logan Airport with other United States airports.

Code	Topic 1	Topic 2	Comment	Response
98.23	Environmental Justice	Demographic Data	[Concerned about] the absence of any substantive environmental justice analysis ...	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order r, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.
98.24	Noise	Open Space/ Parkland	The discussion of impacts of the proposed airside improvements on the Boston Harbor islands is inadequate.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
98.25	Ecosystems	Rare Species	This plan may be adequate but it should be fully aired prior to its inclusion in a Final EIR/S.	The concept mitigation plan presented in the Airside Project Draft EIS/EIR has evolved through discussions between Massport, the Massachusetts Natural Heritage and Endangered Species Program (MNHESP) and the Massachusetts National Guard. Based upon this coordination, Massport has developed a MOU with Massachusetts National Guard for long-term management of the mitigation site at Camp Edwards once Massport has funded the initial grassland restoration project. Furthermore, MNHESP has issued a draft Conservation and Management Permit incorporating permit conditions. Copies of the MOU and the draft permit are contained in Appendix E of the Supplemental DEIS/FEIR.
98.26	Analysis Assumptions/ Methodologies	Air Quality Model	The air quality analysis in the DEIS/R has serious deficiencies, as demonstrated by the comments of Dr. Henry S. Cole....effects of particulate matter with a diameter of less than 2.5 microns ...	Particulate Matter (PM) emission factors for aircraft are very limited, at best, and nonexistent in most cases. Therefore, as a conservative, worst-case assumption, the air quality analysis assumed that all PM is less than ten microns in diameter. No emission factors or approximation methods are available for PM 2.5.
98.27	Environmental Review Process	MEPA	... a Supplemental Draft Environmental Impact Statement/Report is warranted.	Refer to response to Comment 98.4.

LETTER 99

Secretary of Environmental Affairs
Attn: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge St., 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

Laborers' Local 22 is writing today in full support of Massachusetts Port Authority's Airside Improvement plan for Logan International Airport. Local 22 firmly believes that this project is necessary to reduce delays, improve the quality of life of our members and provide much needed employment opportunities.

Delays at Logan are consistently among the worst in the United States. These delays are not only inconvenient, they are costly. In 1998 delays at Logan cost airlines and their passengers nearly $310 million. These losses ultimately affect the livelihood of many working men and women as it impedes the ability of Boston and the region to compete in a global economy.

A major component of the Airside Improvement project, Runway 14/32, provides significant noise relief for our members living in the highest impacted noise areas of East Boston's Bayswater, Revere's Beachmont and Winthrop's Court Road and Point Shirley as well as South Boston's Castle Island area. The new unidirectional Runway shifts 75,000 flights over the water rather than other communities. The proposed centerfield taxiway and other improvements would further enhance air quality by reducing aircraft idling and queuing on the airfield and reduce ground noise from taxying aircraft to adjacent neighborhoods.

99.1
99.2
99.3

With an annual economic impact of $5 billion, Logan International Airport is directly responsible for creating more than 15,000 jobs in this area, many of which are the hard working men and women of Laborers' Local 22.

It is therefore, without reservation, that Laborers' Local 22 wholeheartedly supports Airside Improvements at Logan Airport and eagerly looks forward to the project's approval.

Thank you for your attention to this matter.

Sincerely yours,

Louis A. Mandarini, Jr.
Business Manager

LETTER 100

Please respond to:

38 New Hampshire AV
Massapequa, NY 11758

April 16, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th floor
Boston, MA 02202

SUBJECT: Logan Airside Improvements Planning Project
Boston-Logan International Airport

REFERENCE: Draft EIS/EIR

Dear Sir:

These comments are submitted by Continental Airlines and supplement and expand upon the statement made at the April 8, 1999, public hearing on the subject project held at the Holiday Inn, 225 McClellan Highway, E Boston, MA.

My name is Glenn Morse. I am Senior Director, Industry Affairs, for Continental Airlines. Prior to joining Continental Airlines 14 months ago, I served as Managing Director, Regional Operations, for the Air Transport Association. ATA is the trade association for all the major US passenger and cargo airlines. In my role with ATA, I worked closely with FAA and Massport to implement environmentally acceptable air traffic and airport improvements to reduce the historically high level of delays at Logan. As a result of this involvement, Massport asked me to co-chair the Airside Review Committee which was formed to insure active and extensive community involvement in the planning and environmental processes associated with the Logan Airside Improvements Planning Project.

The Airside Review Committee was comprised of community and business representatives and served as a technical liaison between Massport and the many diverse constituencies around Logan.

In order to further assist the community in the review process, Massport allocated funds to the Logan Community Advisory Committee (CAC) for an independent consultant to analyze and critique the technical results of this study. It is important to note that the CAC's consultant did not dispute and, in fact, accepted Massport's technical findings on the operational benefits and environmental analysis which serve as the basis for this environmental documentation. (See Attachment 1, excerpt from COMMUNITY ADVISORY COMMITTEE POSITION STATEMENT RE MASSPORT'S AIRSIDE IMPROVEMENT PROJECT PROPOSALS, April 9, 1997, to Peter Blute, Executive Director, Massport).

The purpose of this introduction is to describe briefly the extensive coordination process which Massport used to foster understanding of the various components of the proposed Logan Airside Improvement Project.

Continental Airlines supports implementation of all of the airfield improvements and the instrument approach minimums reductions contained in Massport's preferred improvement Alternative 1A. 100.1

Alternative 1A consists of:

Unidirectional Runway 14/32
Midfield taxiway
Minimums reductions for Runways 15R and 33L, 22L and 27
Extension Taxiway D
Realignment of Taxiway N
Southwest taxiway optimization

For the record, we concur with Massport's decision to exclude implementation of peak hour pricing from the preferred alternative at this time because of its limited delay reduction benefit as identified in the Draft EIR/EIS; its adverse economic impacts; and a firm belief that it does not address the primary causes of delay at Logan —wind and weather. 100.2

We support all of the taxiway improvements, most importantly the midfield taxiway, because they will enhance the safety and efficiency of aircraft movements on the airport. These efficiency gains translate to environmental benefits as stated in the Draft EIR/EIS because they reduce taxi times and consequently reduce the engine and noise emissions associated with taxiing aircraft. 100.3

We support the reduction of minimums as proposed because these operational improvements will enhance the safety of our operations, increase the reliability of our operations, and reduce the adverse environmental consequences of unnecessary missed 100.4

approaches and the delays and airborne holding that result. In some circumstances it may also give the tower the ability to change arrival runways to reduce dwell and/or persistence, and better achieve PRAS goals.

Finally, Continental supports the construction of unidirectional Runway 14/32. Everyone acknowledges that 14/32 is not a silver bullet for all of the delays that occur at Logan. However, in good weather, when the winds are from the northwest, there is typically only one arrival runway, Runway 33L. This causes extraordinary arrival delays and holding. When the winds are very strong, all of Logan's traffic must use a single runway for arrival and departure, and delays can exceed four hours. This has been a problem at Logan in the past, is a problem now, and will continue to be a problem in the future regardless of the growth in passengers or operations. 100.5

The new runway, as proposed by Massport, will eliminate most of these delays and their adverse impact on the communities around Logan. Contrary to the assertions of those opposed to the runway, Runway 14/32 does not increase "the overall capacity" of the airport: it does increase the arrival capacity of the Runway 27/33L configuration in good weather to the level achievable with the other two primary configurations of Runways 4L/R and 9, and 22L/R and 27. 100.6

The delays which occur when the airport operates on the Runway 27/33L configuration during heavy traffic periods cause adverse impacts on the communities around Logan in the following ways: 100.7

1. Late flights arrive and depart later in the evening during more noise sensitive hours and are exempt from Massport's existing noise rules.

2. Aircraft holding to land increase noise and emissions over communities around the airport.

3. Finally, and probably most important, these delays cause the tower to use the higher capacity "north/south" runway configurations more frequently. This has occurred in the past, and as the Draft EIS/EIR states – will occur more frequently in the future as traffic increases. (See Draft EIS/EIR Figure 4.5-3, "Jet Overflights by Operating Direction are more Balanced with Runway 14/32," page 4-38).

   The following discussion expands on this last point:

   In order to mitigate the delays which occur in northwest wind conditions, the FAA uses other runway combinations with greater arrival capacity. This increases noise impacts in the communities north and south of the airport affected by those runways, and ultimately prevents FAA and Massport from achieving long standing, community supported runway use goals. The attached runway use statistics for turbojet aircraft compiled by Massport for the period 1980 through 1997 clearly show this preference for a higher capacity runway configuration

starting in 1992. This was precipitated by the worsening delay situation during northwest wind conditions at Logan. FAA statistics show that delays at Logan per 1,000 operations increased progressively from 32.8 in 1991 to 34.6 in 1992 and peaked at 39.2 in 1993.

The four pertinent statistics are:

Runway 33L arrivals
Runway 27 departures
Runway 4R arrivals
Runway 9 departures

Prior to 1992, average annual use for these operations was:

Runway 33L - Approximately 30% annually and never less than 25%,
Runway 27 - Approximately 18% annually and never less than 14.1%, which occurred in 1986, when the runway was closed for approximately six weeks for rehabilitation,
Runway 4R - Approximately 31% and never more than 37.3%,
Runway 9 - Approximately 22% and never more than 26.4%.

Beginning in 1992, in order to reduce delays, the tower began to use Runway 4R for arrival (with Runway 4L) and Runways 9 and 4R for departure in lieu of Runway 33L for arrival and Runway 27 for departure. As a result, the use of Runway 27 for departure dropped to 10%, hit a significant low of 4% in 1993, and has averaged 12% since 1992. Similarly, Runway 33L arrivals dropped to 17% in 1992, and hit a low of 15% in 1993, and have averaged less than 20% since 1992. Runway 4R arrivals increased to a high of 44% in 1993, and have averaged 40% since 1992, and Runway 9 departures increased to 31% in 1992, and 33% in 1993, and have averaged over 30% annually since 1992.

The FAA continues to use the higher capacity "north/south" configurations in order to reduce delay and improve airport efficiency.

In conclusion, at current or any future traffic levels, Runway 14/32 limited to unidirectional use provides safety, capacity and environmental benefits and reduces delays when winds are out of the northwest and contributes to the achievement of existing runway use goals. 100.8

Continental believes the draft EIR/EIS adequately addresses all of the critical environmental and operational issues associated with this important airport improvement program and reaches the most beneficial conclusion for the users of Logan Airport, the communities around the airport, the City of Boston, and the State of Massachusetts. That conclusion is a recommendation to adopt Alternative 1A including the construction of unidirectional Runway 14/32 as the preferred development alternative.

Thank you for the opportunity to comment.

Sincerely,

Glenn Morse
Senior Director
Industry Affairs

T. J. Kinton, Massport

throughout the surrounding affected communities. It is not enough to formally review, decide and mitigate or compensate for aspects of a particular project. Each change must be regarded as an opportunity and a reason to reassess the totality of Logan's impacts, and to readdress them as constructively as possible. Proposed changes do not happen in a vacuum; they accumulate individually into the totality of the whole picture of impacts.

In the case at hand, Massport's stated rationale for proposing the "Airside Improvements Project" is to reduce operational delays to carriers and passengers resulting from conditions and facilities, or lack thereof, at Logan. You must see that the residential communities lying in Logan's shadow do not care about the impacts of delays upon the traveling public (which include themselves) or their air carriers, except to the extent that those delays may cause increased impacts on those communities.

Our responsibility, as the CAC, is to seek improvements in environmental conditions, both overall and in each community. It follows then that our reactions will often differ from those of the business sectors, those having been ably represented on the Airside Review Committee. The role of the CAC, whether as part of the ARC, or independently, is to study and discuss the materials presented and otherwise available data bearing on the issues, and to advise the ARC and Massport regarding community concerns.

We appreciate having been afforded some means of conducting independent reviews, and while we were excluded in the initial process and should have been involved earlier, what was done cannot be undone. The information presented and the manner of presentation has been very helpful in understanding the details of the proposals and the concerns and objectives of the project proponents. Our consultant team has been provided reasonable opportunities to further explore the analyses conducted by your staff and consultants as well.

Massport's consultants have presented information and analyses which depict the proposed project elements as being of value in reducing operational delays to aircraft operations, and their being essentially benign or even environmentally beneficial given certain critical assumptions. Our consultants have advised us that on the technical level those analyses and evaluations are rational and competently performed, and that the data upon which they are based are reasonable.

You must understand, however, that those analyses, and the measures of impact which are employed, while inarguably "state of the art", do not reflect our real world experience over the days, nights and years of "living with Logan". We use the unquantifiable but very real "misery index", a reflection of the cumulative impacts of extended periods of near-constant noise bombardment, interrupted sleep and relaxation, smell, soot and concern for safety.

Are things getting better? Individual aircraft are quieter and cleaner but there are so

Mr. Thomas J. Kinton, Jr.
Director of Aviation
Massachusetts Port Authority
One Harborside Drive, Suite 200S
East Boston, Massachusetts 02128-2909

Dear Tom:

This letter will serve as notice that Delta Air Lines is in support of the Airside Improvement Planning Projects as outlined in the Delay Reduction Program package proposed by Massport for Logan International Airport. In particular, the construction of the new uni-directional runway 14/32 would vastly improve the efficiency of the airfield during certain wind conditions and reduce the delays otherwise experienced when these conditions exist. During such times, the airport is constrained and must operate at a level far below the normal airfield capacity due to the lack of an efficient runway configuration needed to meet the operational requirements that are addressed by other runways in different wind conditions. 101.1

Along with the construction of the new runway, the other projects outlined in the Airfield Improvement Planning Projects package will provide for even greater efficiencies and benefit to the airport.

Respectfully,

cc: Mr. Danny Quillen, Delta Air Lines, Inc.
Mr. Harold Bevis, Delta Air Lines, Inc.
Mr. Dave Bushy, Delta Air Lines, Inc.

Delta Air Lines

LETTER 102

Dave Bushy
Vice President
Flight Operations

May 7, 1999

Mr. Peter Blute
Executive Director and CEO
Massachusetts Port Authority
One Harborside Drive, Suite 200S
East Boston, MA 02128-2909

Dear Mr. Blute:

On behalf of the Delta Air Lines Flight Operations Department, I would like to express my support for the Logan Airside Improvements Project and the construction of a new uni-directional commuter runway as a key element in this major delay reduction initiative.

This new runway will play a major role in enhancing airport operations and reducing delays, particularly during strong northwest wind conditions which limit all aircraft operations to Runway 33L. These conditions result in frequent and often extensive delays that inconvenience our customers, disrupt our otherwise enviable on-time performance, and cost our company hundreds of thousands of dollars annually. My personal experiences as Chief Pilot for Delta in Boston provided me with first-hand knowledge of the need for this runway, as well as the fact that it will not increase noise to airport neighbors. 102.1

Construction of the new runway 14/32 will be a substantive investment in the future of the city of Boston and Logan Airport as a major gateway for air travel in the Northeastern United States. Delta Air Lines strongly recommends moving forward with the Airside Improvement plan.

Sincerely,

Dave Bushy

LETTER 103

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

March 12, 1999

Dear Mr. Durand,

As residents, tax-payers and homeowners in East Boston, we write to urge you to oppose Massport's proposed runway 14/32. According to Massport's EIS report, the runway will reduce delays only 20% of the time AND would be effective only until the year 2003, when delays at Logan will return to present levels. The permanent environmental damage that will be caused Boston residents cannot be justified by this shortsighted proposal. The Eagle Hill Civic Association has worked for the past 15 years to increase awareness about the historical and architectural value of Victorian homes on Eagle Hill, the most densely populated area of East Boston. Because of the work we have done renovating hundreds of homes and buildings, Eagle Hill is now listed on the National Registry of Historic Places and many middle class residents are choosing to move to Eagle Hill, thus building up the City's badly needed tax base. 103.1

Because 14/32 will increase flights on existing runways 27 and 33, residents of Eagle Hill *who already shoulder an unfair portion* of airport noise, fumes and traffic will be permanently and dangerously impacted with triple the amount of planes passing over our homes. This will be a particular danger for our children, as Eagle Hill has the highest concentration of children and schools in East Boston. With 14/32, operations on runway 27 (impacting Roxbury, South Boston, the South End, Dorchester, Jamaica Plain, Roslindale, West Roxbury and Brookline) will increase from 18,000 to 56,495 annually. Operations on runway 33 (affecting East Boston, Chelsea, Charlestown, Hull, Revere, Somerville, Cambridge, Winthrop, Melrose) will increase from 6,082 to over 21,000 annually. Yet, Massport continues to downplay these impacts as "environmentally insignificant." 103.2

Massport's EIS report doesn't mention that fact that *since 1992, delays at Logan have decreased.* This information is publicly available in the Federal Aviation Administration's 1998 ACE (Airport Enhancement Capacity) Report and on the website www.asc.faa.gov. The only reason that Massport can claim that Logan has a "delay problem," is because Massport uses unrealistically high "maximum capacity" goals. Airports such as Dallas or Denver, located on relatively unpopulated land can set higher maximum capacity numbers. Airports located in densely populated urban areas must accept the reality that maximum capacity goals have to be lower than those at airports in non-urban areas, due to environmental and health impacts on local residents. The only reason Massport calls itself a "high delay" airport is because they aim for 120 planes per hour as their maximum capacity. If their goals were set at a more realistic 90 planes per hour (used in other urban airports), Logan would not have a serious delay problem. 103.3

Massport's EIS represents the interests of airlines and airport-related businesses, all of whom stand to make big profits if Logan's overall capacity is increased by runway 14/32. The EIS does not consider health impacts environmental and quality of life issues of Boston's inner city residents. The EIS does not include the negative indemnity of real estate prices for the thousands of homes under the flight paths, nor increased crime and lost tax 103.4

- revenues for the City of Boston when middle class families are forced to move elsewhere because of the excessive plane noise and fumes. Although adequate testing has not been done, I don't believe it is a coincidence that many residents of East Boston are hard of hearing. Hundreds of thousands of people in Greater Boston need your support on this issue. Please reject Massport's EIS, work to keep the present court injunction in place and encourage Massport to seek alternative methods to handle projected air travel increases.

Significantly more flights should be directed to Hanscom Airport, located just 25 minutes from Boston and presently utilized at only a third of its capacity. Hanscom has the runway capacity *right now* to handle commercial commuter planes. Massport must designate Hanscom as a commercial commuter airport instead of a "small corporate jet" airport, as it is now classified. By increasing air traffic at Hanscom, Worcester, Manchester and Providence to the maximum capacity possible, Massport will avoid future delays at Logan with minimal negative impacts on Greater Boston residents who already receive the lion's share of negative impacts from regional air travel. **We desperately need airport impact relief for the existing noise and traffic, not additional negative impacts!** 103.5

Another alternative which Massport has been unwilling to implement is Peak Hour Pricing, a demand management tool which is very successfully used in the hotel and tourism industry as well as the electric utility industry. For profit reasons, airlines prefer to increase capacity rather than manage demand. It is an injustice when greedy profit motives overrule the well-being of human beings. Massport has the opportunity to become a national leader in airport demand management and should give peak hour pricing a year-long trial implementation before proposing the construction of any new runways. 103.6

Massport claims to be a "good neighbor," yet they secretly met behind closed doors with representatives of the media and business sectors to garner their support before publicly announcing plans to build 14/32. *The Globe*, the *Herald* and most major TV networks came out in favor of the proposal even before the MEPA environmental impact report was published! Is this fair play? Is this being a good neighbor? Despite Massport's economic and political advantages, residents of East Boston and Greater Boston will fight this proposal by every means available. We hope we can count on your support.

Sincerely,

Debra L. Cave

Code	Topic 1	Topic 2	Comment	Response
103.1	Purpose and Need	Delay Reduction	...the runway will reduce delays only 20% of the time AND would be effective only until the year 2003, when delays at Logan will return to present levels.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
103.2	Noise	Runway Use	...14/32 will increase flights on existing runways 27 and 33...operations on runway 27...will increase from 18,000 to 56,495 annually. Operations on runway 33...will increase from 6,082 to over 21,000 annually.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
103.3	Delay	Model	Massport's EIS report doesn't mention that fact that since 1992, delays at Logan have decreased. If their goals were set at a more realistic 90 planes per hour (used in other urban airports), Logan would not have a serious delay problem.	The Supplemental DEIS/FEIR contains a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. Airfield capacity is a function of the runways in service, the fleet mix using them, prevailing weather conditions, and FAA air traffic control procedures. Massport cannot arbitrarily define the runway capacity and regulate airline schedules. The highest capacity configuration at Logan Airport today for three runways in good weather is about 120 operations per hour.

Code	Topic 1	Topic 2	Comment	Response
103.4	Environmental Justice	Impacts	The EIS does not consider health impacts environmental and quality of life issues of Boston's inner city residents.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study*. Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.
103.5	Regional Alternatives	Regional Airports	...more flights should be directed to Hanscom Airport...By increasing air traffic at Hanscom, Worcester, Manchester and Providence to the maximum capacity possible, Massport will avoid future delays at Logan....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. With recent service developments, Manchester and T.F. Green/Providence airports, are becoming attractive alternatives for Logan Airport passengers that originate in communities north and south of Routes I-95 and I-495. By its agreement to assume operational responsibility and the eventual ownership of the Worcester Regional Airport, Massport is working to increase air services at Worcester Regional Airport and is working to increase the airport's role in accommodating air travel demand generated in communities west of I-95 and I-495. Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion.

Code	Topic 1	Topic 2	Comment	Response
103.6	Alternatives	Peak Period Pricing	Massport...should give peak hour pricing a year-long trial implementation before proposing the construction of any new runways.	The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport is prepared to initiate a process, as described in Section 4.5.4 of the Supplemental DEIS/FEIR, to initiate the rule-making process to implement PPP at that time.

LETTER 104

Mr. Robert A. Durand, Secretary
Executive Office of Environmental Affairs

02128

April 8, 1999

Dear Mr. Durand,

The more we hear Massport and business sectors (most of whom do not live in Boston) promote runway 14/32, the angrier we get. Massport has misrepresented the truth and manipulated data to support the runway. **Massport's EIS is inadequate because it is based on 1993 figures** (a year that happened to be a record high for delays). According to the FAA (www.asc.faa.gov), delays at Massport are significantly lower today than in 1993. Frankly, nobody considered Massport an "extremely delayed" airport before Massport announced its plans to build runway 14/32. Over the last two months, pro-runway news stations and newspapers have regularly proclaimed that Logan is "notorious" for delays. Massport is engaging in an unfair and exaggerated propaganda war to increase anxiety about delays, something that nobody complained about before runway 14/32 was announced.

Because 1998 data shows that *Logan's delay situation is improving,* Massport chose to use 1993 statistics. Moreover, the EIS barely includes alternatives to 14/32, because Massport lacks the political WILL to implement alternatives. This violates MEPA regulations and renders the EIS invalid. We urge you to dismiss this biased document and consider the following points. **If Runway 14/32 is built,** it will not only TRIPLE the amount of environmental impacts for the worst affected communities, but **will remove incentive to immediately implement regional transportation planning. 14/32 will not solve the root causes of delays at Logan:**

104.1

#1 Small planes and corporate jets are allowed to land at Logan, delaying the take-offs and departures of large commuter carriers. Small planes and corporate jets should be sent to Hanscom Airport, which has the runway capacity and is ideally located for corporate commuters heading towards the 128 and 495 area. Yes, this will mean modest air traffic expansion for rural communities abutting Hanscom, but considering that the noise contour lines for Hanscom Airport fall on open fields and woods, no residential homes would receive noise decibel levels comparable in intensity to those suffered by hundreds of thousands of people around Logan. Expanding operations at Hanscom would mean that a relatively small number of residents would receive relatively small noise increases. Expansion at Logan means that hundreds of thousands of already impacted residents will receive very large noise increases. The justice issue is clear. Furthermore, businesses and tourism will flourish in Boston whether people land at Logan or 25 minutes to the West in Bedford. Massport didn't even *mention* this solution in its EIS.

104.2

#2 Logan has no major feeder airports. If you look at the airports that rank higher than or roughly the same as Logan in delays, you will note that ALL of them have two, three or more major feeder airports. San Francisco has SFO International, Oakland International and San Jose International all within 20-45 minutes of San Francisco. New York has Kennedy, La Guardia and Newark all within 30-45 minutes of town. If Massachusetts had a second international or national airport within an hour of Boston, imagine how quickly delays at Logan would go down!

104.3

#3 Massport sets unrealistic flight per hour goals, given its densely populated, urban surroundings. 120 planes per hour (24 hours per day!) should not be allowed. Were Massport to use the more realistic number of 90 planes per hour, Logan would have no delay problem. Abutters of Logan are in desperate need of noise relief, not noise increases. We sincerely hope that your agency will consider these issues and reject Massport's EIS. By doing so, Massport will receive a strong message that it needs to design a long-term, socially-responsible, regional air traffic plan for the 21st century. Thank you.

104.4

Debra L. Cave

Debra L. Cave, President
East Boston Eagle Hill Civic Association

Letter 104
East Boston Eagle Hill Association
Debra L. Cave, President

Code	Topic 1	Topic 2	Comment	Response
104.1	Analysis Assumptions/ Methodologies	Base Year	Massport's EIS in inadequate because it is based on 1993 figures...According to the FAA...delays at Massport are significantly lower today than in 1993...1998 data shows that Logan's delay situation is improving....	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. Analysis of 1981 to 90 weather with 1989-98 weather identifies no significant differences in statistical properties.
104.2	Regional Alternatives	Regional Airports	Small planes and corporate jets should be sent to Hanscom Airport....	Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations. In 1998, it accommodated 183,000 general aviation operations compared to 32,000 general aviation operations at Logan Airport. The Hanscom Field activity includes private, business, charter, and air-taxi operations that might otherwise use Logan Airport. While approximately 45 percent of commercial aircraft activity at Logan Airport is on small planes, Massport plays no role in the decisions of private airlines regarding air service routes or service levels. Airlines are unlikely to move a significant number of these flights to Hanscom Field, since approximately 50 percent of passengers on these flights connect to other flights operated at Logan Airport.
104.3	Regional Alternatives	Regional Airports	Logan has no major feeder airports...If Massachusetts had a second international or national airport within an hour of Boston, imagine how quickly delays at Logan would go down!	Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.
104.4	Delay	Model	Massport set unrealistic flight per hour goals...Were Massport to use the more realistic number of 90 planes per hour, Logan would have no delay problem.	Airfield capacity is a function of the runways in service, the fleet mix using them, prevailing weather conditions, and FAA air traffic control procedures. Massport cannot arbitrarily define the runway capacity nor airline schedules. The highest capacity configuration at Logan Airport today for three runways in good weather is about 120 operations per hour. Proposed airside improvements, such as Runway 14/32, are intended to fill in the capacity gap which exists under some conditions such as northwest wind and to reduce delays at those times.

LETTER 105

Mr Arthur Pugsley, Reviewer

Exedcutive Office of Environmental Affairs

100 Cambridge Street

Boston Massachusetts 02202

RE:EOEA #10458

Dear Mr Pugsley:

These comments are submitted for the East Boston Land Use Advisory Council after duly noticed meetings and votes taken according to its by-laws. The Council is an East Boston community group, organized in 1968 and in continuous session since that time. The mission of the Council, hereinafter called LUC is to provide a forum and advocacy for zoning, licensing, recreational and planning issues which generally affect the quality of community life in East Boston and these comments are submitted in accordance with that mission and purpose.

The referenced Draft EIS/EIR has been submitted in support of Massachusetts Port Authority (MPA) proposal called Logan Airside Improvements Planning Project (the Project), and, after due consideration LUC has voted, on March 25, 1999 and April 1, 1999 to request the Secretary to reject this Document and the Project proposed thereby.

Statement of Proposal

The referenced document proposes that MPA build a runway, compass points 140/320 degrees, a centerfield taxiway, and, in the Federal submission, a reduced approach height minimum to 18' all proposals being for the purpose of claimed operation delay management and improved operation safety. Document specifically states that no increase in operation capacity is facilitated by the specific "airside improvements" and that the impacts of the "airside improvements" be considered and evaluated separately from previously proposed and implemented "groundside improvements"

Analysis of Proposal

LUC submits that the proposal overstates and fails to analyze correctly the delay situation at Boston-Logan International Airport and further states an inaccurate picture of delay trends and forecasts. The proposal is further flawed by failure to present and analyze alternative delay reduction strategies that would reduce

delays without implementing the runway/ taxiway build schemes and their accompanying environmental and economic impacts on the affected communities. These failures violate the requirements of both NEPA and MEPA requiring comparative alternative analysis to "build" and further, the requirement in both Acts to not "segment" the impacts of related components of a proposal such as "Groundside" and "Airside" which are clearly related in their cumulative impacts on the affected communities.

The argument of MPA that "Groundside" (passenger handling) and "Airside"(aircraft handling) are severable, and that neither, alone or cumulatively generates traffic and capacity expansion is, on its face, tenuous and based on assumptions that deny a reasonable view that these developments are closely related and necessarily cumulative in their environmental impacts. While it is true that MPA will not control passenger and cargo operation growth at Logan, the reasoning is not that such growth cannot be controlled and managed, but rather that to exercise such control would be contrary to the fundamental economic purposes of MPA's development. The growth of operations and ensuing revenues support MPA's financial strength and to limit this growth would impair MPA's revenue stream and, thus, its bond covenants. MPA will not take measures to limit or manage operation growth, and, from a strictly economic standpoint, should not do so. Applicable law, however, including National Environmental Policy Act of 1969, Department of Transportation Act of 1966 and Massachusetts Environmental Policy Act set a much broader scope of requirements for review of the Project's supporting off-documentation. Specifically, the following items should be required to be addressed in the Project documentation:

1. Discussion of diversion of cargo operations to off-airport the off- alternatives. 105.1

2. Considering the off-airport alternatives as separate scenario for evaluation in DEIS/DEIR process. 105.2

3. Evaluation of MPA-owned Hanscom Field as a reliever airport for general aviation operations, origin/destination regional non-jet traffic, and short-haul origin/destination jet traffic. 105.3

4. Consideration of #3 and other sitings for a second major Massachusetts Airport, with particular consideration of 1996 Executive Order relative to environmental justice. 105.4

5. Analysis of existing delays at Logan owing to specifically wind/weather effects and indirectly from delay at other airports. 105.5

LUC submits that such indirect delay will not be relieved by the Airside project, and should not be included in the alleged benefit thereof.

6. Documentation of history of PRAS (preferential runway assignment) as management tool and analysis of problems with implementation thereof. 105.6

The Secretary should determine that significant planning deficiencies exist in the DEIS/DEIR and a new Draft document(not an amended version) be submitted.

The "base year" of 1999 does not adequately reflect changes since that time, and a base of 1998 extending to 2020 should be required as proportionate to severity of impacts and to implement appropriate planning horizons. For example, delays at Logan have not significantly increased 1993 according to FAA modeling standards and therefore do not justify MPA's projections for future delays. Further, weather data does not allow for significantly changed weather conditions in the period from 1981-1990 to present. 105.7

Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations directly because of the sought-for effect of delay reduction. 105.8

The projected increases in passenger demand and capacity to handle such demand from the airside/groundside expansions will be met by increased "passenger jet" operations. The overflight impacts on 15/33 communities including East Boston will be disproportionate and the noise reduction benefits of stage 3 conversion are mostly already realized since only about 15% of the fleet remains to be made stage 3 compliant.

Further, the number of extremely noisy nighttime jet operations already required to be stage 3 compliant are seen to double in the foreseeable future and therefore no further noise reduction benefit whatsoever is to be derived on these increases.

Project documents tout the noise mitigation to be achieved through additional soundproofing treatment in impacted community. This benefit, such as it might be, will be disproportionately unavailable 105.9

In the poorer impacted communities because of the greater likelihood that residences will be non-compliant with relevant building codes and economic ability to achieve code-compliance is disproportionately lacking.

Alternatives to the build proposal are required to be " rigorously explored and evaluated" and alternatives, which were eliminated from detailed study, should be explained referencing briefly reasons for eliminating these alternatives. 105.10

The economic benefits of Logan are incorrectly conflated with those of Boston itself but the loss from the Boston-area impacts are conveniently neglected.

Boston worked best in a transportation environment predominantly emphasizing rail and water transport. The siting of Logan into preexisting urban areas was attempt to to gain advantage over other further-out airports. But the advantages gained, even temporarily thereby, have been constantly attended by disproportionately severe and unjust impacts. The current proposal is a clear and unfair extension of this bad history, and must be rejected to force a more rational approach to regional transportation solutions.

Code	Topic 1	Topic 2	Comment	Response
105.1	Regional Transportation	Cargo	Discussion of diversion of cargo operations to off-airport the off-alternative [should be discussed].	Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
105.2	Regional Transportation	Regional Alternatives	Considering the off-airport alternatives as separate scenario for evaluation in DEIS/DEIR process [should be discussed].	The regional alternatives were explicitly considered in the delay reduction and environmental analyses by studying a range of future demand and activity levels. Passenger levels analyzed cover a range from 29M passengers to 45M passengers. Similarly, 510,000 to 656,000 future aircraft operation levels were analyzed. The use of variable long-term passenger and operations forecasts allow for uncertainty relating to the rate of future economic growth, the development of high-speed rail alternatives, the acceptance and usage of video-conferencing, and the role of regional airports. The delay reduction analyses indicate that the proposed airside improvements, as well as the regional alternatives, are necessary for accommodating current and future levels of demand.
105.3	Regional Transportation	Regional Airports	Evaluation of MPA-owned Hanscom Field as a reliever airport for general aviation operations, origin/destination regional non-jet traffic, and short-haul origin/ destination jet traffic [should be discussed].	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

Mara\ALP\7469\Docs\Reports\Renumbered Comments & Responses\Interest Groups 2.doc

Code	Topic 1	Topic 2	Comment	Response
105.4	Regional Transportation	Regional Airports	Consideration of ...[Hanscom Field] and other sitings for a second major Massachusetts Airport, with particular consideration of 1996 Executive Order relative to environmental justice [should be discussed].	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.
105.5	Delay	Model	Analysis of existing delays at Logan owing to specifically wind/weather effects and indirectly from delay at other airports [should be discussed].	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion by addressing constraints at Logan Airport. Delays caused by conditions at other airports or other factors, such as mechanical failure, are not addressed since Massport cannot influence these delays. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.
105.6	Noise	PRAS	Documentation of history of PRAS...as management tool and analysis of problems with implementation thereof [should be discussed].	The Supplemental DEIS/FEIR includes a discussion of PRAS including its historic development and the performance relative to the goals over time. PRAS goal achievement has improved considerably over time, particularly since the installation of the Enhanced PRAS in 1993 and the Revised PRAS in 1996. Chapter 8 also outlines a monitoring program that will provide regular updates on PRAS performance and serve as an aid to identify problems or areas for improvement.
105.7	Analysis Assumptions/ Methodologies	Base Year	The "base year" of 1999 [1993] does not adequately reflect changes since that time, and a base of 1998 extending to 2020 should be required....	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
105.8	Environmental Review Process	NEPA	Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations....	Implementation of the elements of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. Refer to the discussion in Section 4.2 in the Supplemental DEIS/FEIR.
105.9	Noise	Sound Insulation	...soundproofing treatment...will be disproportionately unavailable in the poorer impacted communities because of the greater likelihood that residences will be non-compliant with relevant building codes...	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport sponsored sound insulation program. However, to address impacts in particular projects such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of the mitigation program to the extent such improvement are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes. For the eligible residences, the FAA will fund building code improvements, to the extent necessary, to implement effective sound insulation treatment.
105.10	Environmental Review Process	MEPA	Alternatives to the build proposal are required to be "rigorously explored and evaluated" and alternatives, which were eliminated from detailed study, should be explained referencing briefly reasons for eliminating these alternatives.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to FAA scoping directives, applicable FAA environmental orders and all other NEPA requirements.

ELLIS NEIGHBORHOOD ASSOCIATION, INCORPORATED
Post Office Box 961, Back Bay Annex, Boston, MA 02117

LETTER 106

April 22, 1999

Secretary Bob Durand
Executive Office of Environmental Affairs
Environmental Impact Review
100 Cambridge Street
Boston, MA 02108

FAX 617-727-1598

Attention Arthur Pugsley

The Ellis Neighborhood Association, located in the South End, would like to comment on the Massachusetts Port Authority proposal to add a runway and reconfigure taxi ways at Logan Airport to reduce delays at the facility.

Unfortunately, the cost of the proposal is too high. It is estimated that the flights over the South End will increase from roughly 18,000 a year to over 40,000 a year, and then grow from there. This is an increase from nearly 50 flights a day to 115 flights a day, assuming the flights are spread evenly over 365 days. But these flight will largely occur during periods of "non prevailing winds", estimated at 25% of the time, which suggests as many as 444 flights a day (40,000 flights divided by 90 days). This is unacceptable. 106.1

Some of these planes are so noisy, one has to stop conversations until the plane has passed. These planes should be banned from using Logan.

Other planes fly so low they take a long time to rumble by. These planes should be directed to fly over the ocean until they reach an altitude high enough so the sound is dissipated (and then hopefully turn toward land at someplace other than over the city).

Thank you for the opportunity to comment.

Very truly yours,

Elizabeth S. Boveroux
President

Code	Topic 1	Topic 2	Comment	Response
106.1	Noise	Impacts	It is estimated that the flights over the South End will increase from roughly 18,000 a year to over 40,000 a year...This is unacceptable.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.

LETTER 107

To: Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458

From: Richard J. Egan, Chairman, EMC Corporation

Date: April 8, 1999

Subject: Massport's Plan to Improve Logan Airport

This note is sent in support of Massports plan to improve the timeliness, safety and environment of Logan Airport and it's surrounding area.

My reasons for this are best described by the attached Op-Ed piece which appeared in the March 28th edition of the Boston Herald.

Additionally, I have studied this plan and firmly believe that it will in fact improve the overall environment by decreasing the noise and jet exhaust over the adjacent inhabited areas.

I hope that your study of this matter is not diverted by the opponent's claims that other regional airports are a better solution.

While there are serious plans currently underway to provide better access to other airports they unto themselves are not the solution offered by this Massport plan whose implementation has long been delayed by a small but vocal group who will remain dissatisfied with Logan until it is shut down.

Respectfully yours,

RJE:mlh

Economy demands new runway

Do you realize our region's link to global markets, tourism dollars, customers and conventioneers can be shattered by something as simple as a strong northwest wind? That key link is Logan Airport. And when northwest winds prevail, as they often do, Logan can operate only two of its runways — and sometimes only a single runway.

No surprise, then, that when it comes to time-wasting and money-wasting delays, Logan is one of the worst airports in the country. In fact, Logan's airfield is so inadequate that, according to Massport, it cost corporations more than $310 million in lost productivity last year.

Richard J. EGAN

Consider my company, EMC Corp. We are now the largest computer company headquartered in Massachusetts. Every day, several hundred EMC sales reps, engineers and executives fly in and out of Logan — as do their thousands of counterparts from other companies. Clearly, I and EMC's 3,800 Massachusetts workers have a lot invested in Logan. Logan is our gateway to the world. But we find it incredible that on a bright, clear, sunny day, with not a snowflake in sight, flights into Logan can be delayed up to three hours ... all due to weather.

As a coastal airport in New England, Logan is subject to the whims of Mother Nature. Snow, fog and poor visibility all can cause delays. While I am never happy to hear that EMC employees and customers are affected by delays at Logan, at least it is understandable when a foot of snow has fallen or fog is blanketing Boston.

The cause of the problem is simple: There have been no improvements made to Logan's airfield in over 20 years. To meet peak demand, Logan needs three runways in operation. The makeup of Logan's airfield is such that when winds blow from the Northwest, delays can total thousands of hours.

This problem will not go away on its own. Logan's delays will worsen if nothing is done, and the cost to our economy will continue to grow. The issue has been talked about for more than 20 years, and for 20 years the problem has gotten worse.

Should we wait until companies start to pack their bags in search of a more efficient transportation link? What about when large conventions pass on Boston's new convention center because getting into the city is too much of a hassle? We cannot afford to wait any longer.

I'm concerned enough about Logan and its ability to keep this state tied to the global economy that I have set up a coalition of more than 50 Massachusetts CEOs who want to help Massport make Logan better.

The Logan On Time Committee is composed of companies like Gillette, Analog Devices, Teradyne and Fidelity. All told, these corporations employ 500,000 people in this state. These are companies where thousands of workers travel for a living; companies where jobs, profits and state tax revenues depend on getting from Boston to other cities, Europe, Asia and the rest of the world quickly and reliably. Our group is working overtime to make sure Massport goes ahead with construction of a new runway.

My business depends on Logan to succeed, so I am making its success my business. The pace of EMC's business doesn't slow down when there are northwesterly winds. Neither should Logan's.

Richard J. Egan is founder and chairman of EMC Corp. of Hopkinton, a provider of enterprise computer storage systems, software and services.

LETTER 108

April 22, 1999

Secretary of Environmental Affairs
Attn: MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge St., 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

The International Brotherhood of Teamsters Union, Local 379, is writing today in full support of the Massachusetts Port Authority's Airside Improvement plan for Logan International Airport. Local 379 firmly believes this project is necessary to reduce delays, improve the quality of life of our members and provide much needed employment opportunities.

Delays at Logan are consistently among the worst in the U.S. These delays are not only inconvenient, they are costly. In 1998 delays at Logan cost airlines and their passengers nearly $310 million. These losses ultimately affect the livelihood of many working men and women as it impedes the ability of Boston and the region to compete in a global economy. 108.1

A major component of the Airside Improvement project, Runway 14/32, provides significant noise relief for our members living in the highest impacted noise areas of East Boston's Bayswater, Revere's Beachmont and Winthrop's Court Road and Point Shirley as well as South Boston's Castle Island area. The new unidirectional Runway shifts 75,000 flights over water rather than over communities. It also allows noise impacts to be spread more equitably across communities. The proposed centerfield taxiway and other improvements would further enhance air quality by reducing aircraft idling and queuing on the airfield and reduce ground noise from taxing aircraft to adjacent neighborhoods. 108.2 108.3

With an annual economic impact of $5 billion, Logan International Airport is directly responsible for creating more than 15,000 jobs in this area, many of which are the hard working men and women of Local 379.

It is therefore, without reservation, that Local 379 wholeheartedly support's Airside Improvements at Logan Airport and looks forward to the projects approval.

Thank you for your attention to this matter.

Sincerely yours,

Paul V. Walsh
Secretary-Treasurer
Principal Executive Officer

LETTER 109

April 23, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley--EOEA No. 10458
100 Cambridge Street
20th floor
Boston, MA 02205

Dear Mr. Pugsley:

Fidelity Investments is a global financial services company and the largest mutual fund firm in the United States. We have 12,600 employees in Massachusetts, including nearly 10,000 at our world headquarters in Boston. We are the largest private employer in Suffolk County and the 4th largest private employer in Middlesex County.

For a large, growing company like ours, the proximity of a convenient airport offering reliable and safe air travel is an absolute necessity. We strongly support the modernization of Logan Airport and the construction of runway 14/32 because an inefficient Logan hurts the productivity of businesses, wastes time and money and negatively impacts the local and regional economy. 109.1

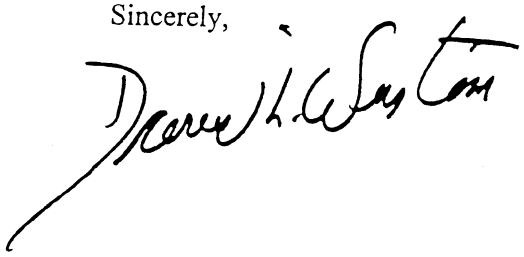
We have other major operations within New England, in New Hampshire and Rhode Island, and in five other states. A convenient, efficient airport is a critical factor in deciding where to locate and where to grow. It is no accident that our New Hampshire and Rhode Island facilities, where a combined 3,700 employees work, are within short drives of the Manchester and T.F. Green airports, respectively. We support any and all efforts to expand usage of those regional airports (and Worcester and New Bedford), not only because it helps serve our employees in other locations, but also alleviates Logan's congestion and contributes to a diversified and robust New England economy. 109.2

Logan Airport has an annual economic impact of $5 billion, providing jobs for 15,000 citizens and supporting more than 100 airport-related businesses. Put simply, Logan contributes $13.7 million to the local economy every single day. While ranking 11th in operations among U.S. airports, Logan has the 6th-worst delay problem. In 1998, Logan suffered from 120,000 delay hours at a cost of $319 million.

In 1998, Fidelity spent almost $50 million in airline tickets -- about 75 percent of which was travel through Logan. Fidelity employees traveled on more than 100,000 flights to and from Logan last year. Employees at a company like ours, with headquarters in Boston, must be able to travel easily and without undue delay to other locations in the U.S. and around the world. With 15 million customers in all 50 states, we have customers wherever airplanes can fly.

Unfortunately, we have an airport that often does not work. We must do better for our economic vitality today and for the future fiscal health of the Commonwealth. Construction of runway 14/32 should lead to greater growth, new jobs and a competitive regional economy leading into the 21st century.

Sincerely,



Letter 109
Fidelity Investments
David C. Weinstein, Chief of Administration and Government Affairs

2oth Floor
Boston, MA 02205

LETTER 110

Dear Mr Pugsley:

As President and CEO of Fitcorp, a Massachusetts company with 95 employees, I am writing you to state my strong support of a series of transportation initiatives, notably the Logan Airport modernization along with improvements to our high speed rail system and greater utilization of the Worcester, Providence and Manchester airports. My company's success is contingent upon a strong economy in Boston. The five leading industries that account for more than half of the jobs in our region are dependent upon a Logan that operates efficiently.

Logan's transportation services are essential to the economic success of the entire region. Unfortunately, Logan is one of the most delay prone airports in the county, ranking sixth in 1998. No changes have been made to Logan's airfields since 1977, and since then, operations have increased by 112%. Massport's plan for a new runway designed for all arrivals and departures taking place over Boston Harbor should lead to greater growth, better jobs, and a competitive regional economy. 110.1

With the development of a new convention center there will be an increased demand for air traffic in Greater Boston over the next decade. Runway 14/32 at Logan will help us meet this demand. In addition, we need to increase utilization at the regional airports in Worcester, New Bedford, Providence, and Manchester and also incorporate high-speed rail into our region. 110.2

Our future economic competitiveness hinges on Logan's modernization. Thank you for your consideration.

Sincerely yours,

Gary T. Klencheski

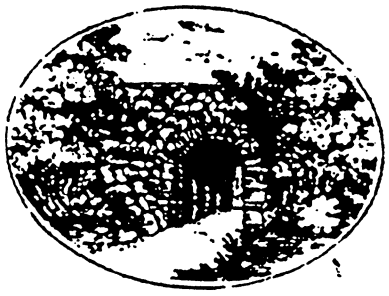
110.1	Purpose and Need	Delay	...Logan is one of the most delay prone airports in the country ...there will be an increased demand for air traffic in Greater Boston over the next decade. Runway 14/32 at Logan will help us meet this demand	Comment noted.
110.2	Regional Alternatives	Regional Airports	...we need to increase utilization at the regional airports in Worcester, New Bedford, Providence, and Manchester and also incorporate high-speed rail into our region.	Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. While greater use of the regional airports and high-speed rail will provide relief to Logan Airport, the proposed Airside Project provides clear benefits at current, as well as future, traffic levels. The benefits will only increase in the future, even as regional transportation developments act to reduce the rate of future growth at Logan Airport.



The Franklin Park Coalition

LETTER 111

April 21, 1999

Robert A. Durand, Secretary
Executive Office of Enviromental Affairs
100 Cambridge Street - Room 2000
Boston, Massachusette 02202

Attention: MEPA Office

Re: Massachusetts Enviromental Protection Act review of Massachusetts Port Authority's Enviromental Impact Statement concerning proposed construction of Runway 14/32 at Logan Airport.

Dear Secretary Durand:

I write on behalf of the Board of Directors and the membership of The Franklin Park Coalition to oppose the construction of Runway 14/32 because it would increase already excessive and noisy flights over Franklin Park and because we believe parts of Massport's EIS to be inaccurate.

The Franklin Park Coalition (Coalition), formed in 1974 in response to the deterioration of Franklin Park (the Park), is dedicated to the restoration and preservation of the Park and to safeguarding the design of Frederick Law Olmsted.

Franklin Park is the only park in the city of Boston large enough, at 500 acres, to create the illusion that one has left the city. This rural experience was the intent of Olmsted's design and the purpose of the Park.

Despite being over 6 miles from Logan Airport, flights from Runway 27 are so low and so loud as they pass directly over the Park as to disrupt entirely the peace and enjoyment intended for Park users.

These users include: birdwatchers, strollers, joggers, picnicers (it is one of the few Boston parks which allow cookouts), bicyclists, dog-walkers, golfers, neighborhood softball players, schoolchildren and visitors to The Franklin Park Zoo. All these activities are spoiled by the noise of Logan flights.

Currently, flights from Runway 27 number approximately 19,000 a year. Under Massport's proposal these flights would increase to approximately 56,000 a year.

Massport downplays the level of noise from Logan flights by averaging the decibel level of flights with the decibel levels between flights. This is tantamount to determining a speeding violation by averaging the speeds

111.1

a driver maintains at a red light with the speeds used on a highway. We believe this practice to be inaccurate, fraudulant and disingenuous.

The Coalition believes it is unreasonable that Massport's Logan operations continue to degrade the quality of life in Franklin Park as elsewhere in the Greater Boston area. For this reason we ask you to reject Massport's EIS and join us and others in requiring Massport to use regional airports, Peak Hour Pricing and other alternatives which will lower Logan's maximum flight capacity goals.

The Coalition believes that Franklin Park, where urban dwellers can retreat from urban life, is unique and a treasure to be safeguarded. It would be egregious to sacrifice this wonderful Park to the dubious demands of a short-term efficiency.

We thank you for this opportunity to comment and ask that this letter be entered into the official record of any proceedings concerning Massport's application to build Runway 14/32.

Very truly yours,

The Franklin Park Coalition

Code	Topic 1	Topic 2	Comment	Response
111.1	Noise	Impacts	Massport downplays the level of noise from Logan flights by averaging the decibel level of flights with the decibel levels between flights. We believe this practice to be inaccurate, fraudulent and disingenuous.	The Supplemental DEIS/FEIR considers a variety of noise metrics in the assessment of noise impacts from the various alternatives. These are intended to shed additional insight on how the noise is likely to change from one alternative to another. It is suggested the reader also refer to Appendix E for a discussion of noise metrics.

LETTER 112

Friends of Belle Isle Marsh

April 22, 1999

~~Trudy Coxe~~ Robert Durand
Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
20th Floor
Boston MA 02202
Attn: MEPA Unit

Dear ~~Ms. Coxe~~ Mr. Durand:

The Friends of Belle Isle Marsh (FBIM) is a nonprofit organization dedicated to protecting Belle Isle, the 250-acre saltmarsh located within the communities of East Boston, Revere and Winthrop. Since its creation in 1985, Belle Isle Park and Reservation has served as an urban oasis, affording city dwellers a rare opportunity to observe and enjoy nature at close hand.

Despite the constant threat of encroachment by Logan Airport, the MBTA, and the numerous commercial, marine and industrial operations that surround it, Belle Isle has managed to survive as a functioning saltmarsh and habitat for wildlife not usually found in such close proximity to urban neighborhoods.

Therefore, our special perspective is not only that we must protect the many species of birds, mammals and fish that live in Belle Isle Marsh, but that we must also ensure its peaceful use and enjoyment by human beings, as well.

It is arguable that the current levels of noise and air pollution caused by operations at Logan Airport already make a negative impact on the use and enjoyment of the marsh resources; but to argue that point is not our brief, at present. Addressing the plan at issue, as described in Massport's Draft Environmental Impact Statement/Report, the Friends find that this report is seriously deficient in its treatment of impacts under Section 4(f) of the Department of Transportation Act of 1966, as amended.

Our specific objections are as follows:

(1) On page ES 30-31, under the subhead Section 4(f) Determination, Massport states:

> Indirect impacts to Section 4(f) resources from implementation of the Preferred Alternative [1A]...were also considered...According to the legislation which established the Boston Harbor Islands Recreation Area, the extension of noise contours over Boston Harbor associated with unidirectional runway 14/32 would not be considered to constitute a use, or have a significant effect on the reccreation area...The proposed airside improvements at Logan Airport will not incorporate land from a section 4(f) resource, nor with soundproofing mitigation, affect the normal activity or aesthetic value of a public park, refuge, or historic site.

Despite the fact that Belle Isle Park and Reservation is the largest public parkland bordering Logan Airport, by definition clearly falling within the guidelines of Section 4(f), and that more of its acreage is directly under aircraft landing approaches than the Harbor Islands Recreation Area, Massport completely excludes Belle Isle from the discussion. On what grounds does Massport then conclude that the proposed airside improvements will not, "...with soundproofing mitigation, affect the normal activity or aesthetic value" of Belle Isle Park and Reservation? What method could, or would, Massport propose that would effectively soundproof a 150-acre park 200 feet below jet aircraft on a landing approach? The data to support these statements is not fully disclosed in this EIR (see no. 3, below.) 112.1

(2) See also Chapter 5 of the EIR, page 5-2, in which FAA requirements are discussed. Massport states that "there are several categories of resource that would not receive impacts, or would receive insignificant impacts" because "there are no parklands...on the airfield site." This does not constitute a full disclosure nor a thorough discussion of all the possible negative impacts of the proposed airside improvements. The existence of Belle Isle Park as a contiguous public park and nature reserve is not even mentioned (let alone the many other public parks and recreation areas nearby), and the data to support such conclusions is not included in this report or its appendices. 112.2

(3) None of the many noise contour maps included in this report specifically addresses the noise effects of the proposed Alternative 1A on Section 4(f) resources. The existing noise contour maps in the EIR are not easily usable in this regard, since they do not clearly show the location of Section 4(f) resources, including Belle Isle Marsh. However, it appears that all or most of Belle Isle Marsh, and Belle Isle Park within Belle Isle Marsh, may fall at least within the 65 DNL noise contour, and much of it may fall within the 70-75 DNL noise contour, under every scenario considered, both in 2010 and the 1993 baseline. Massport should specifically address this question, preferably by using actual monitoring data rather than computer modeling, and by presenting this data in legible tables or maps. 112.3

(4) Again, Massport focuses on the Harbor Islands Recreation Area, to the exclusion of Belle Isle Marsh, when it discusses Environmental Consequences in Chapter 6. The FAA's National Environmental Policy Act regulations require any proposed airport projects to demonstrate "land use compatibility." Based only on the fact that the legislation establishing the Boston Harbor Islands Recreation Area states that Logan Airport "shall not be deemed to have a significant effect on natural, scenic, and recreation assets...", Massport can conclude that the proposed improvements are not incompatible with "recreation assets" only by excluding Belle Isle Park and Reservation from this discussion.

The Reservation, unlike the Harbor Islands Area, was established by The Commonwealth and is not governed by the restrictive language of the federal statute. Thus, Massport is not absolved from its obligation to consider the effects of the proposed airside improvements on Belle Isle Marsh under FAA environmental criteria. 112.4

(5) Finally, as part of the Section 4(f) determination, the EIR has identified a state-listed endangered species, the upland sandpiper, nesting in the area of the proposed Centerfield Taxiway (see Chapter 6, sections 6.4.4, 6.4.5.) Massport proposes a mitigation that will include habitat enhancement both onsite and offsite to ensure that there is a "net benefit" to the upland sandpiper population. However, by way of documentation, Massport offers (in Technical Appendix N) only a letter from the Massachusetts Division of Fisheries and Wildlife in response to Massport's initial inquiries. This is very far from being a fully disclosed mitigation plan. Has Massport contacted the Defense Department and reached agreement on the use of Camp Edwards as a mitigation site? Is there provision for ongoing monitoring of the upland sandpiper population, in order to measure the effectiveness of the mitigation? These are some of the elements of a well-thought out mitigation plan that should have been addressed in this EIR. 112.5

In addition to the points we have listed above, there are many other areas in which this EIR is deficient; however, the Friends feel that the strongest objection lies not in what Massport has included in this report but in what it has left out.

It defies both reason and logic for Massport to assert that a 50 percent increase in air operations at Logan over the next 10 years will have no significant impact on the natural resources surrounding the airport. The only way for Massport to sustain this position is to leave out of the EIR any meaningful data that would allow us to measure changes in noise, air and water pollution levels in Belle Isle Marsh. We urge MEPA to find this draft EIR unacceptable, and we thank you for your careful consideration of these comments.

Sincerely,

Gail Miller, Chairperson, Conservation Committee
Elizabeth Regan, Vice President
FRIENDS OF BELLE ISLE MARSH

Letter 112
Friends of Belle Island Marsh
Gail Miller, Chairperson
Conservation Committee

Code	Topic 1	Topic 2	Comment	Response
112.1	Noise	Sound Insulation	On what grounds does Massport then conclude that the proposed airside improvements will not "...with soundproofing mitigation, affect the normal activity or aesthetic value" of Belle Isle Park and Reservation?	The noise levels in the vicinity of Belle Island Park and Reservation are lower with the Preferred Alternative than with the No-Action Alternative. The difference can be seen by comparing the values of the Day-Night Sound Level (DNL) at Monitor No. 8 (Morton and Amelia in Winthrop) and Monitor No. 16 (Bradstreet and Sales in Revere) which bracket the Belle Island Marsh area. With the 29M Low Fleet scenario, the DNL at Monitor No. 8 decreases by 0.1 dB and at Monitor No. 16 by 0.4 dB. With the 37.5M Low Fleet scenario, the DNL at Monitor No. 8 decreases by 1.1 dB and at Monitor No. 16 by 1.4 dB.
112.2	Open Space/ Parkland	Impacts	..."there are no parklands...on the airfield site." The existence of Belle Isle Park as a contiguous public park and nature reserve is not even mentioned....	There are no parklands on the airfield site, as depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR. In addition, Belle Isle Park, while within the existing No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
112.3	Noise	Impacts	None of the many noise contour maps included in this report specifically addresses the noise effects of the proposed Alternative 1A on Section 4(f) resources...it appears that all or most of Belle Isle Marsh...may fall at least within the 65 DNL noise contour... Massport should specifically address this question, preferably by using actual monitoring data rather than computer modeling, and by presenting this data in legible tables or maps.	Figure 5-19 in the *1997 Massport GEIR Update* shows that the 1996 and 1997 DNL 65 dB contours include about one-half of the marsh area. These two contours appear to occupy about the same area as does the 1993 reference contour in Figures 6.2-9 through 6.2-12 of the Supplemental DEIS/FEIR which are over less clear maps. The contours for all the alternatives for 1999 and 2010 appear to be inside the 1993 contour in the Belle Island Marsh area. Therefore, the noise exposure for the Belle Island Marsh area is expected to continue to decrease in the future. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR.
112.4	Open Space/ Parkland	Impacts	The Reservation unlike the Harbor Islands Area, was established by The Commonwealth and is not governed by the restrictive language of the federal statute. Thus, Massport is not absolved from its obligation to consider the effects of the proposed airside improvements on Belle Isle Marsh under FAA environmental criteria.	Refer to response to Comment 112.2.
112.5	Ecosystems	Rare Species	...upland sandpiper population. Has Massport contacted the Defense Department and reached agreement on the use of Camp Edwards as a mitigation site? Is there provision for ongoing monitoring of the upland sandpiper population, in order to measure the effectiveness of the mitigation?	Chapter 6 of the Supplemental DEIS/FEIR documents the agreements developed between Massport and the MAANG.

LETTER 113

Greater Boston Chamber
The Hub of Business

April 23, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02205

John C. Silva
Manager, Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Re: EOEA #10458

As President and Chief Executive Officer, I appreciate the opportunity to on behalf of the Greater Boston Chamber of Commerce to present our views on Logan International Airport and other regional transportation alternatives. The Greater Boston Chamber of Commerce is a non-profit organization that represents more than 1,700 of the leading businesses in our region. The Chamber supports the vision outlined in the four volume *Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report EOEA #10458.*

113.1

We support this vision for a reason noted in the first chapter of the first section of the first volume: "The essential role that Logan plays in the regional economy is threatened by a serious problem of aircraft delay."

More broadly, we support an R^2 approach -- the construction of runway 14/32 in conjunction with the greater utilization of regional airports both inside and outside Massachusetts. Neither the runway nor the regional airports alone will serve all of our transportation needs. In conjunction with one another, however, both the runway and the regional airports can make our transportation system more efficient and improve the quality of life for those who live both near and far from major transportation nodes.

Logan's Importance

Annually, Logan has an impact of $5 billion, provides employment for more than 15,000 individuals, and supports more than one hundred airport-related businesses. Put another way, Logan contributes almost $13.7 million to the local economy every single day.

A recent survey of Chamber members reveals that two in three find convenient and frequent air service extremely important to their companies. Additionally, more than three in four expect their business usage of Logan to increase over the next five years, which means that if we do nothing today, Logan's problems will soon significantly worsen. Inaction now means that in just five years we will look back to the halcyon days of 1998, when Logan suffered from 120,000 delay hours, which the Draft EIS/EIR notes, "produced an aggregate cost of $313 million to airlines and their passengers."

The Chamber publication *Greater Boston's Leading Industries: Drivers of the Regional Economy 1999-2000* reveals that financial services, health care, high technology, knowledge creation, and tourism provide more than half of the jobs in our region. The draft EIS/EIR asserts, "Each of these sectors depends on high quality of air transportation services for their continued success." To further this success, or, in other words, to keep the Massachusetts job machine working well, we must rectify the competitive disadvantage that Logan will become in the future.

The Chamber spearheaded city-to-city trips to Atlanta in 1997 and to Seattle in 1998. These cities, as well as our other competitors around the country, are modernizing their airports. We must do the same in our great city so that, for instance, companies do not move their headquarters out of our region. Such moves would mean fewer jobs for Massachusetts.

The Need for Runway 14/32 and the Taxiway

The Federal Aviation Administration statistics listed in the Draft EIS/EIR bear out the fact that Logan should but does not serve as a competitive advantage for Boston. While ranking seventeenth in terms of passenger volume at U.S. airports, Logan suffers from the sixth worst delay problem. To help to address this discrepancy, the Greater Boston Chamber of Commerce endorses both the over-the-water runway, which would reduce delays by 25 percent annually, and the taxiway improvements, which will cut delays by some 15,000 hours per year 113.2 113.3

Economically, Boston will continue to thrive only if it has the best resources rather than the worst problems. The imminent construction of the new convention center reaffirms this axiom, but only if Logan meets two conditions. First, the airport must improve so that conventioneers will want to fly into Boston. Additionally, after having made this destination decision, conventioneers will need to have positive travel experiences by arriving in Boston and at the convention center (or their hotels) in a timely fashion.

Regional Airports and Other Transportation Alternatives

As noted, the Chamber also supports the initiative to increase the use of regional airports in Worcester, New Bedford, Providence, and Manchester. Notably, the Commonwealth is already spelling out its regional plans. 113.4

Specifically, the state seeks to have Massport operate Worcester, extend commuter rail service to T.F. Green Airport in Providence, and make roadway improvements to Manchester. Regarding Worcester, Draft EIS/EIR figure 2.4-2 shows that its airport captures only nine percent of market area passengers, the lowest share by far of any of six New England airports. This statistic suggests that an opportunity exists to grow the Worcester Airport.

On the ground, high-speed rail will bring the northeast corridor to our great city. With a stop at South Station, the Silver Line will move residents and visitors alike from Dudley to Logan with stops in the Seaport District.

But all of these transportation projects, worthy in their own right, do not relieve Logan's already heavy and soon to be heavier burden. The Draft EIS/EIR asserts that "even the diversion of up to 7 million passengers would not eliminate the need for airfield improvements designed to reduce airside delays and increase Logan's operational efficiency."

To extend the example of the convention center, business people will not fly into regional airports when Logan lies across the Harbor from the Seaport District. While some 1.2 million people per year will utilize high-speed rail, more than 35 million others will still use Logan by 2010. Finally, the Silver Line provides brilliant connections from the airport into downtown and beyond, but will only prove worthwhile if we make every effort to modernize Logan.

Conclusion

We need a modernized airport to bring people to our great city. Today, we have an airport that all too often does not work. We must do better for our own economic vitality today and for the future fiscal health of our city, state, and region.

In summary, therefore, both the modernization of Logan and the increased utilization of other transportation alternatives should lead to greater growth, better jobs, and a stronger regional economy as we confront the increasingly competitive 21st century.

Thank you for considering the views of the Greater Boston Chamber of Commerce.

Sincerely,

Paul Guzzi, President and
Chief Executive Officer

Code	Topic 1	Topic 2	Comment	Response
113.1	Purpose and Need	Delay	The Chamber supports the vision outlined in the four volume *Logan Airside Improvements Planning Project Draft Environmental Impact Statement/Report EOEA #10458.* We support this vision for a reason noted in the first chapter of the first section of the first volume: "The essential role that Logan plays in the regional economy is threatened by a serious problem of aircraft delay."	Comment noted.
113.2	Alternatives	Runway 14/32	...endorses...the over-the-water runway, which would reduce delays by 25 percent annually....	Comment noted.
113.3	Alternatives	Taxiway Improvements	...[endorses] the taxiway improvements, which will cut delays by some 15,000 hours per year.	Comment noted.
113.4	Regional Transportation	Regional Airports	...supports the initiative to increase the use of regional airports in Worcester, New Bedford, Providence, and Manchester.	Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. While greater use of the regional airports and high-speed rail will provide relief to Logan Airport, the proposed Airside Project provides clear benefits at current, as well as future, traffic levels. The benefits will only increase in the future, even as regional transportation developments act to reduce the rate of future growth at Logan Airport.

LETTER 114

Dear Chamber Member:

The Greater Boston Chamber of Commerce supports a series of transportation initiatives, notably the Logan Modernization project (including runway 14/32) and a greater emphasis on regional alternatives (such as high speed rail and an increased utilization of Worcester, Providence, and Manchester airports). We need your help to publicize business perspectives on these vital issues, particularly with respect to Logan. Our future economic competitiveness hinges on Logan's modernization. The five leading industries that account for more than half of the jobs in our region depend on a Logan that works well.

Greater Boston Chamber
The Hub of Business

Actions

- The public comment period on the environmental permitting will run until April 23. Using the talking points below, please send letters (and blind copy me) on Logan by that date to both:

  Secretary of Environmental Affairs
  Attention MEPA Office
  Mr. Arthur Pugsley - EOEA No. 10458
  100 Cambridge Street
  20th Floor
  Boston, MA 02205

  John C. Silva
  Manager, Environmental Programs
  Airports Division, ANE-600
  New England Region
  12 New England Executive Park
  Burlington, MA 01803

- Please consider testifying at one or both of the joint federal/state hearings to comment on Logan that will take place on April 7 and April 8. If you can testify or would like to provide more assistance with this effort, please call Mark Stemman at 617/557-7345 for more information about how these hearings work.

Talking Points for Your Comments *Please incorporate specifics on how Logan impacts your organization.*

- **Logan means jobs.** Annually, Logan has an economic impact of $5 billion, provides employment for more than 15,000 individuals, and supports more than one hundred airport-related businesses. Put another way, Logan contributes almost $13.7 million to the local economy every single day.
- **Logan's delay problems are bad and getting worse.** While ranking eleventh in terms of operations of U.S. airports, Logan suffers from the sixth worst delay problem. In 1998, Logan suffered from 120,000 delay hours at a cost of $319 million.
- **Regional transportation measures do not provide enough relief for the delay problem.** We endorse the initiative to increase the use of regional airports in Worcester, New Bedford, Providence, and Manchester. We support high-speed rail to bring the northeast corridor to our great state. But these measures will not handle all of the increased demand for air traffic in Greater Boston by 2010.

We have an airport that all too often does not work. We must do better for our own economic vitality today and for the future fiscal health of our state. The construction of runway 14/32 should lead to greater growth, better jobs, and a competitive regional economy as we continue to face increased competition in the 21st century. We look forward to working with you on this vital issue.

Sincerely,

Paul Guzzi

Paul Guzzi, President and
Chief Executive Officer

STATEMENT OF PAUL GUZZI
April 7, 1999

Good evening. For the record, my name is Paul Guzzi. I serve as President and Chief Executive Officer of the Greater Boston Chamber of Commerce, a non-profit organization that represents more than 1,700 of the leading businesses in our region.

Thank you for allowing me to share a few thoughts on Logan International Airport and other regional airports. I want to commend the federal and state governments for holding this joint public hearing.

First, whether and how we can modernize Logan will determine the future economic well being of our region. Annually, Logan has an impact of $5 billion, provides employment for more than 15,000 individuals, and supports more than one hundred airport-related businesses. Put another way, Logan contributes almost $13.7 million to the local economy every single day.

The Chamber, the Commonwealth, and the federal government all try to grow the job-creating segments of our economy. In this region, the Chamber has characterized these economic engines -- financial services, health care, high technology, knowledge creation, and tourism -- as the five leading industries. These industries provide more than half of the jobs in our region. To increase jobs, we must rectify the competitive disadvantage that Logan has become today and will increasingly become in the future.

Second, worsening delay problems at Logan will dramatically impact Boston businesses. While ranking seventeenth in passenger volume, Logan suffers from the sixth worst delay problem in the nation. In 1998, Logan suffered from 120,000 delay hours at a cost to us all of more than $300 million per year.

A recent survey of Chamber members reveals that three in four expect their business usage of Logan to increase over the next five years, which means that inaction today will lead to Logan's problems significantly worsening in the future. The Chamber survey also shows that more than fifty percent experience more delays at Logan than at other airports, whereas only 7.4 percent faced fewer delays in Boston.

Third, we support other regional transportation projects to take some of the burden off Logan. We endorse Logan modernization because even the realization of these projects will not provide sufficient relief for the delay problem. Specifically, the Chamber endorses both the over-the-water runway and the initiative to increase the use of regional airports in Worcester, New Bedford, Providence, and Manchester. As a forthcoming Chamber white paper will demonstrate, we also support high-speed rail to bring the northeast corridor to our great city. 114.1 114.2 114.3

These worthy transportation projects do not relieve Logan's already heavy and soon to be heavier burden. While some 1.2 million people per year will utilize high-speed rail, more than 35 million others will still use Logan by 2010. We need a modernized airport to bring people to our great city.

We have an airport that all too often does not work. We must do better for our own economic vitality today and for the future fiscal health of our city, state, and region. Runway 14/32 will lead to fewer delays, greater growth, better jobs, and a more competitive region as we enter into the increasingly global economy of the 21st century. 114.4

114.4	Purpose and Need	Delay	We need a modernized airport to bring people to our great city. Runway 14/32 will lead to fewer delays, greater growth, better jobs, and a more competitive region as we enter into the increasingly global economy of the 21st century.	Comment noted.

LETTER 115

GREATER GARDNER CHAMBER OF COMMERCE

1898 • 1998
A CENTURY OF SERVICE

March 29, 1999

Mr. Arthur Pugsley
Executive Office of Environmental Affairs
MEPA Office
100 Cambridge Street
20th Floor
Boston, MA 02202

Dear Mr. Pugsley,

The Greater Gardner Chamber of Commerce, representing over 650 area businesses and over 12,000 employees throughout the Greater Gardner area, strongly supports MASSPORT's proposal for the development of a dedicated commuter runway at Logan International Airport.

Runway 1432 will be a dedicated runway for small-passenger commuter air traffic, generally 10, 20 and 30 passenger commuter planes. The development of this dedicated runway will provide for the maximization of existing longer commercial runways for larger airliners using Logan International.

Currently, Logan International Airport is ranked the 6th worse in the country for delays. The development of Runway 1432 will provide a great deal of relief and help alleviate the delay problems at Logan. The Greater Gardner Chamber of Commerce recognizes the need to alleviate the delay problems as a critical economic development initiative in the Commonwealth. 115.1

The Greater Gardner Chamber of Commerce stands strong in its commitment to continue the economic prosperity of the Commonwealth of Massachusetts and certainly Central Massachusetts, and supports the development of Runway 1432 as an important part of this economic development strategy.

If the Greater Gardner Chamber of Commerce can be of assistance in this matter, please contact me directly at (978) 632-1780, extension 11.

Sincerely,

Michael F. Ellis
President & CEO

LETTER 116

April 20, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley--EOEA No. 10458
100 Cambridge Street - 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

I am a frequent flyer, and therefore a "frequently delayed flier" when I'm trying to get back home to Boston. I'm writing to register my support for the proposed runway at Logan that would serve commuter aircraft. Massport's position on the runway makes sense to me – I believe that more efficient commuter flight operations would decrease delays *and* decrease the total noise level for surrounding communities. 116.1

The alternative suggestion that commuter operations be moved to Hanscom is not sensible. Most commuter flights serve connecting passengers who come into Logan on a large jet via a full service airline. 116.2

Please note that I live in Brookline, and that I am a member of the Brookline Transportation Board.

Sincerely yours,
FULD & COMPANY INC.

Michael A. Sandman
Senior Vice President

Re: EOEA No. 10458

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor
Boston, MA 02202
ATTN: Arthur Pugsley, MEPA Office

Dear Secretary Durand:

I write to urge that you find the Draft EIS presented by Massport in support of its proposed Runway 14/32 "airside improvement" project unacceptable.

The environmental and human impacts of further expansion of Logan Airport—whether through construction of Runway 14/32 or some other scheme yet to emerge from Massport's drawing boards–are simply too high. Nor has Massport made its case that Logan expansion is either a necessary or a desirable solution to our region's long-term transportation needs.

As detailed in the attached documents and elsewhere as well, environmental evidence against Massport's proposal is overwhelming.

Massport's proposal fails on any number of measures: It goes against the most fundamental environmental objective of all, which is to reduce impacts from current levels that are already too high, not merely manage (or allegedly manage) their trend ever upward; it flouts basic precepts of environmental justice that impacts should be distributed fairly across racial and socio-economic lines: it has been pushed forward without sufficient process for citizen involvement or acknowledgement of their concerns; and it seems to beg or sidestep as many questions and issues as it answers.

Specifically:

Massport has been neither forthright nor forthcoming about the true implications and impacts of its present expansion plan; the DEIS, therefore, is not a full disclosure document, as required by federal guidelines. With respect to environmental and human impacts:

Massport fails to consider that 14/32 is a growth-enabler likely to promote (not reduce) increased emissions. In evaluating air quality impacts of proposed runway 14/32, the DEIS adopts an approach that makes no apparent connection between a new runway and Logan's overall ability to handle the increased passenger loads projected by Massport. It's a strange and surprising position given Massport's oft-repeated

claims that delays at Logan will become intolerable to the traveling public without 14/32.

Feedback mechanism. It is probable that construction of a new runway will in fact create new opportunities for growth in airport operations, and consequently, in aircraft and motor vehicle emissions. *Viewed this way, Massport's assertion that air quality impacts from 14/32 are beneficial or negligible is just downright wrong.* 117.1

Massport pays scant attention to Logan's role in MA's ozone problem. Eastern Massachusetts is a serious non-attainment zone for ozone, and Logan ranks as a major source of precursors like oxides of nitrogen (NOx) and hydrocarbons that are key ingredients in ozone production. Yet the DEIS explores the issue superficially, despite its own projection that Logan growth will cause significant increases in NOx emissions in coming years. Nor does the DEIS address how Logan-related increases will affect Massachusetts' ability to meet tougher ozone standards slated to take effect next year. 117.2

Ground-level ozone. Ground-level ozone is associated with respiratory impairment and illness, especially in children and people with chronic respiratory conditions. *The issue raises concern with respect to residents across eastern Massachusetts, because the ozone impacts of precursor emissions are often greatest some miles from their original source, in this case Logan airport.*

Massport gives short shrift to air pollutants known to have serious health consequences. The DEIS glosses over or ignores key areas of concern with respect to air quality, including hazardous air pollutants, fine particulates, and noise. The medical literature clearly shows that all present serious cause for concern, especially for persons living near Logan airport.

Hazardous air emissions. The DEIS fails to properly consider certain hazardous air pollutants (HAPs) like benzene and formaldehyde that are known or probable carcinogens, through its misleading use of overly-broad categories. Airports are a major source of such HAPS in urban areas. 117.3

Fine particulates. Massport's own projections show significant increases in emissions of particulates with diameters less than 10 microns. That is undesirable in and of itself, but worse, the DEIS fails to adequately treat the special concerns associated with particulates of less than 2.5 microns. An increasing body of literature documents the adverse health effects associated with particulate air pollution, including symptoms of respiratory disease such as shortness of breath, cough, and asthma attacks. *Of special concern is the possibility that air quality levels in neighborhoods nearest Logan may be unacceptable already with respect to fine particles.* 117.4

Noise. The DEIS and Massport's treatment of noise as largely a nuisance factor to be dealt with only within the confines of narrowly-drawn and ill-defined contours is unacceptable. In fact, the scientific literature shows that noise can be a major health risk. *And, as the testimonials in this report and citizen comments at numerous hearings and meetings make clear, Massport's presumption that soundproofing is a satisfactory "answer" to noise means that whole neighborhoods must live hermetically-sealed lives, in which residents are denied use or enjoyment of their own outdoor property, and are left even unable to open their windows* 117.5

Massport understates or omits significant emissions, including motor vehicle traffic. The DEIS omits certain sources of emissions and appears to substantially understate others:

Motor vehicle traffic and emissions. Massport projects many millions of additional passengers using Logan in the years ahead. How will they get there, and what will be the emissions associated with growth in ground transportation to and from Logan? *The DEIS appears to sharply understate these motor vehicle emissions, by assuming—inexplicably—that motor vehicle traffic growth will lag well behind passenger growth; the direct opposite of what has actually proven true in recent years.* Also, the DEIS takes no account of emissions from motor vehicle traffic beyond Route 128 117.6

Aircraft emissions above 3,000 feet. The DEIS analysis does not include aircraft emissions at altitudes of above 3,000'. 117.7

There are some broader, more philosophical points, too, that provide equally compelling evidence against the DEIS and Massport's proposal. Massport appears to have deliberately framed this DEIS and its public arguments in support of a new runway as narrowly as possible, as if this were purely an exercise in airfield design, undertaken in a vacuum, or perhaps some remote desert.

In reality, of course, Logan sits at the center of one of nation's most densely populated regions. *In that context, Massport must be expected to show the same concern for the needs of, and attention to the impacts on, its human neighbors on the ground as it devotes to the passengers on its runways or the aircraft in the sky.*

Yet:

Massport's proposal flouts the tenets of environmental justice, Massport's proposal clearly flouts President Clinton's Executive Order No. 12898, making environmental justice a key criterion. Massport's proposal would further burden racially and income-diverse communities like East Boston, Roxbury, and Chelsea—communities that already face disproportionate and unfair environmental impacts from a number of sources (including, significantly, Logan). 117.8

Massport has ignored residents' concerns about potential existing impacts. Many residents of communities around Logan like East Boston, Chelsea, Winthrop, and others have offered serious and thoughtful concerns about potential health effects associated with existing levels of Logan usage. The DEIS fails to address these issues—yet sadly, similar concerns elsewhere have too often proved well-founded. A 1993 EPA study of Chicago's Midway airport, for example, found that certain emissions associated with aircraft operations at that much smaller facility contributed significantly to cancer cases in surrounding neighborhoods. *To answer residents' concerns and as a guide to transportation policy making, Massport should be required to thoroughly assess potential health effects associated with existing levels of Logan operations on Massachusetts residents.* 117.9

Massport lacks a long-term transportation plan that could de-emphasize Logan, and shift our region away from ever-increasing reliance on air travel. In preparing its DEIS, Massport was required to explore all reasonable alternatives. Instead, Massport appears to have looked seriously at only its traditionally preferred alternative: Expand Logan. And, equally, the DEIS reflects the fact that Massport has chosen to needlessly embrace the false notion that reliance on air travel must inevitably always trend upward.

Massport instead must be required to operate within the context of a true long-term transportation plan for our region, one that: (1) makes maximum best use of other airports in our region like T.F. Green and Manchester; but (2) shifts us away from ever-increasing reliance on air travel, and toward transportation alternatives like high-speed rail that have far lower environmental and human impacts. 117.10 117.11

In closing, one final observation: As someone with over two decades experience as an environmental and community organizer, I have never seen the diverse people of Boston and surrounding cities and towns so united as in their shared opposition to 14/32. As one East Boston resident says within the testimonials attached to these comments: "Enough is just enough."

To me, comments like those, made over and over by so many citizens at meetings and hearings these past few months, speak more eloquently and convincingly than anything else to all that is wrong with Massport's proposal to expand Logan.

Sincerely,

JOHN T. O'CONNOR

OPEN CITIZEN LETTER
TO
GOVERNOR PAUL CELLUCCI &
MASSPORT CHAIRMAN PETER BLUTE

Dear Sirs:

We the citizens of Massachusetts impacted by the proposed changes to **Logan International Airport** demand the following of Massport:

1. A binding and legal agreement which halts any existing plans to expand **Logan Airport** in any way, shape or form. Including but not limited to the completion of the proposed Runway 14/32 and the centerfield taxiway. Instead, we demand a regional transportation plan that addresses New England's long-term transportation needs with less reliance on **Logan.** 117.12 117.13

2. An outside evaluation of **Logan Airport** which assesses performance and makes recommendations for improvements within the existing infrastructure. 117.14

3. Establishment of a citizen's advisory board to serve as a liaison between **Massport** and the effected communities. This board will develop a comprehensive and inclusionary process of mitigation to eliminate the arbitrary, ill-devised process that currently exists. 117.15

4. Appropriation of funds to conduct an Environmental Impact Study which includes an in-depth, long-term study of **Logan Airport's** impact on all surrounding cities and towns within heavily travelled flight paths. 117.16

5. Creation of a Good Neighbor Agreement between residents and **Massport** that requires **Massport** to provide a forum for good faith negotiations. 117.17

THE IMPACT OF LOGAN AIRPORT EXPANSION ON AIR QUALITY AND PUBLIC HEALTH

By

Henry S. Cole, Ph. D.
Henry S. Cole & Associates, Inc.
Washington, D.C.

EXECUTIVE SUMMARY

Introduction. Massport proposes to build a new runway for Logan Airport. Its Environmental Impact Statement (EIS) argues that the new runway is needed to reduce delay. However, the EIS also projects a major expansion period for the next decade. Massport forecasts that passenger load will increase from an estimated 29 million in 1999 to from 37.5 million to 45 million passengers by the year 2010. This represents a growth rate from 29 to 55 percent. *Surely, the runway is an important first step to achieving Massport's projections.*

This report finds that the EIS (1) fails to acknowledge the runway's impact on growth and (2) neglects to fully examine the consequences of its projected expansion - consequences that will effect the surrounding communities and the region as a whole. This report focuses on the impacts of Logan expansion on air quality; however, the full set of consequences also include congestion of roadways, noise levels, water quality, and the very livability of greater-Boston area communities.

Logan Airport even at its current size has a major impact on the region.

- Airport has been ranked as the Nation's 12th largest airport with a current annual use rate of approximately 29 million passengers in 1999.

- Logan handles about two-thirds of the passenger load in New England. This airport is also the largest generator of motor vehicle traffic in New England. Traffic jams on the roadways leading to Logan are already legendary.

- The air and auto traffic associated with Logan Airport imposes a variety of environmental stress factors -- including noise and air pollution -- on people living in one of the most densely populated regions of Massachusetts and the nation. (See Fig. 1).

- Logan airport is a major source of air pollutant emissions. VOC's and NOx are particularly important because they contribute to the region's serious non-attainment status for ground-level ozone. (See Section 4). For example, Logan Airport emits more than 7 tons per day of oxides of nitrogen (NOx) which is approximately 7 percent of the anthropogenic NOx emissions in Suffolk County.

The impact of expansion on air quality. Major findings are as follows:

- **Increased emissions of NOx and Particulates.** The Environmental Impact Statement (EIS) for Airside Improvements Planning (February 1999) forecasts that growth in Logan use over the next decade will cause significant increases in emissions of oxides of nitrogen (NOx) and particulate matter (PM10). Ironically, new quieter jets have higher NOx emissions.

- **Increased NOx and its impact on Ozone.** Increased NOx is especially significant. NOx is an essential ingredient for the formation of photochemical smog including ground-level ozone. Massachusetts has been designated by EPA as a "serious" non-attainment zone for ozone. Ozone is known to cause and aggravate respiratory disease in humans. Children are especially vulnerable. Ozone is a regional problem -- Logan NOx emissions affect smog tens of miles from the source. The EIS fails to address the NOx / ozone question in a meaningful manner, for example, Massport has not included emissions caps in its preferred alternative. 117.18

- **Additional impacts of increased NOx.** Increased NOx emissions has additional consequences. It contributes to acid rain which has damaged both waterways and forests in the northeast. Scientists have also determined that NOx emissions to air are a major source of nitrate deposition to coastal waters and estuaries; this results in over-fertilization, oxygen depletion, and severe damage to estuarine ecosystems and fisheries.

- **Hazardous Air Pollutants**. Airports a significant source of hazardous air pollutants (HAPs). An EPA study of Chicago's Midway (much smaller than Logan), found that HAP emissions from aircraft contributes an estimated 10.5 percent of the cancer cases related to air pollution in the 16 square mile area surrounding the airport. Motor vehicle traffic (much of which is attributable to the airport) was the dominant source of cancer risk. A number of these "HAP's" (e.g., benzene, formaldehyde) are known or probable human carcinogens -- they can cause cancer. The EIS fails to assess or project emissions trends for this particularly dangerous component of VOC and fine particulate emissions. 117.19

- **Fine Particulates.** The report presents evidence suggesting that neighborhoods located near Logan Airport may be experiencing dangerous levels of PM2.5, the smallest class of particulates and those having the most devastating impact on public health. Since the EIS projects increased particulate emissions, PM2.5 emissions and ambient levels in the surrounding region can be expected to rise with continued expansion of the airport.

- **Motor Vehicles and Emissions**. Projections of motor vehicle emissions used in the EIS incorporate Massport predictions of future growth in the volume of traffic approaching and using the airport. Massport projects an additional 12,000 cars per week-day over the next decade to accommodate passenger growth. However, Massport data showing the relationship between passenger use and traffic volume over the past five years suggests that Massport is "low balling" the growth in traffic volume needed to accommodate its forecasts. This report shows that a better estimate may be on the order of 30,000 to 50,000 additional vehicles. Using these figures would lead to higher future CO, VOC, NOx emissions than those projected in the EIS. 117.20

- The "emissions gap" problem is heightened by the EIS's neglect of emissions outside of I-95 /128 and aircraft emissions at altitudes greater than 3000 feet. 117.21

Summary. In summary, this report finds that Massport's EIS fails to acknowledge that a new runway will act to stimulate new growth and allow for expansion and is deficient in its assessment of the environmental impacts of Logan expansion. 117.22

In simple terms, neither the EIS, the runway proposal, nor Massport's vision for Logan Airport future is respectful of real world limits -- limits that involve the people who live in area and that involve the environment. Massachusetts has been designated as a "serious" non-attainment zone for ozone. The airport already imposes a burden of fine particulates and hazardous air emissions on the surrounding area, the most densely populated in New England. Massport has failed to demonstrate that increased emissions associated with its projected expansion will not adversely affect public health and the environment. The evidence presented above indicates that the growth projection embraced by Massport will have a serious impact on community health.

Recommendations.

- The State of Massachusetts should reject the current EIS as deficient. Massport and state authorities should replace the current Logan expansion plan with a regional transportation based on energy-efficient inter-city rail and improvement of the many other New England airports. 117.23

- The state should initiate a true stakeholder involvement process to initiate the planning process for a regional transportation plan. Representatives of airport communities, environmentalists, rail and mass transit representatives and their experts should be involved in the process. 117.24

- Massachusetts Department of Environmental Protection should ensure that EIS fully address significant environmental problems. 117.25

1.0 Introduction. Logan Airport has been ranked as the Nation's 12th largest airport with a current annual use rate of approximately 29 million passengers.[1] Logan is also the largest generator of motor vehicle traffic in New England.[2] The air and auto traffic associated with Logan Airport imposes a variety of environmental stress factors -- including noise and air pollution -- on people living in one of the most densely populated regions of Massachusetts and the Nation. (See Fig. 1).

This report focuses on the air pollution impacts of increased use of Logan Airport. The Environmental Impact Statement (EIS) for Airside Improvements Planning (February 1999) forecasts that growth in Logan use over the next decade will cause emissions of oxides of nitrogen (NOx) and particulate matter (PM10) to increase substantially. According to the EIS, emissions of volatile organic compounds (VOC's) and carbon monoxide (CO) will increase if the higher growth rate (to 45 million passengers in the year 2010) are realized.

The EIS clearly shows that the greater the expansion, the more emissions. Emissions will increase because the shear increase in aircraft operations and vehicular traffic projected will overwhelm whatever temporary benefits may result from a new runway and other improvements. Moreover, many of the air pollution impacts associated with increased use will occur in some of the most densely populated regions in the state. (See Fig. 1).

Subsequent sections of this report demonstrate that the EIS for Logan Airside Improvements fails to (a) fully acknowledge the consequences of its "airside improvement plan" on air quality and (b) to adequately examine the health and environmentally-related impacts of the increased emissions that are predicted in the document.

2.0 New Runway - Impact on Emissions. One of the most glaring deficiencies in the EIS is that it fails to consider the impact that the a new runway will have on growth-related emission trends. The EIS takes the position that the new runway and other "airside improvements" are simply modifications that improve efficiency. Massport makes the case that at some given level of passenger use (e.g., 29 million), the new runway will reduce aircraft congestion, idling and planes in holding patterns, improvements that should work to mitigate emissions.

However, Massport's analysis fails to consider that adding a new runway is likely to create a feedback mechanism that will in turn affect the airport's rate of growth. Although, the new runway may initially improve efficiency, it will also provide an opportunity for expanded use.[3] The new runway, is analogous to the highway dilemma. Traffic planners add lanes to relieve congestion, yet fail to predict that they ultimately lead to more bigger traffic jams in the future. 117.26

The EIS report, by failing to use an iterative growth model, presents a flawed assessment of the true impact of the airside improvements over time. Without considering feedback to growth, Massport cannot back its assertion that "the overall impacts associated with the

Airside Project Alternatives are beneficial or will remain imperceptible" from an air quality standpoint.[4]

In fact, common sense dictates that the 29% to 55 % increase in passenger use forecast by Massport for the next decade would not be feasible without the new runway. The new runway is a capacity enhancement that will promote rather than manage growth. And as Section 3.3 shows, expansion has a strong impact on the growth of emissions.

3.0 Current and Projected Emissions for Logan Airport.

3.1 Current emissions. Table 1 is a summary of 1997 air emissions as estimated in the Boston-Logan International Airport, 1997 Annual Update.[5] This table shows estimated emission rates for carbon monoxide (CO), oxides of nitrogen (NOx), volatile organic compounds broken down by sources associated with the airport. (Particulate matter was not included in the GEIR update.)

This table shows that aircraft emissions are the largest single sources of emissions at the airport and contribute more than 80 % of NOx emissions, more than 61 % of VOC emissions, and about 42% of the CO emissions associated with the airport.

3.1.1 Logan Airport as a major emitter in the greater-Boston Area. Logan airport is a major source of air pollutant emissions. VOC's and NOx are particularly important because they contribute to the region's serious non-attainment status for ground-level ozone. (See Section 4).

Logan Airport emits more than 7 tons per day of NOx which is approximately 7 percent of the anthropogenic NOx emissions in Suffolk County.[6]

Logan emits more than 3 tons per day of VOC's which represents approximately 4 percent of the anthropogenic VOC emissions from Suffolk County.[7]

Logan Airport has NOx emissions comparable to emissions from the state's largest industrial and power generating plants.[8]

3.2 Certain emissions not included in EIS inventory. A problem with the EIS analysis is that certain emissions associated with the use of Logan Airport are not considered in the assessment of environmental impact. Thus, the EIS understates the full impact of an expanding Logan Airport.

Specifically, the analysis does not include aircraft emissions that occur at altitudes greater than 3000 feet. As shown in Sections 4 - 5 emissions of NOx and other pollutants aloft can have a number of adverse environmental impacts.[9] These impacts would be diminished with a shift to energy efficient passenger trains. 117.27

- The emission inventory does not include emissions from motor vehicles driving to and from Logan Airport that lie beyond I-95/Route 128.

- The EIS (Feb. 1999) does not include in its emissions inventory or projections certain critical pollutants; these include specific hazardous air pollutants (HAP's) and PM2.5 (the smallest particulates with diameters less than 2.5 microns). As shown in Sections - 6 and 7, these types of air emissions, omitted in the Airside Improvement EIS, are especially significant from a health standpoint.

3.3 Logan Expansion / Emission Trends.

3.3.1 Use Projections. Massport's EIS projects that use of Logan Airport will increase dramatically in the coming decade. Massport envisions two expansion scenarios for the airport:

- Less expansion: passenger use grows from 29 million in 1999 to 37.5 million in 2010.

- More expansion: passenger use grows to 45 million in 2010.

The projected increase in passengers over the next decade is shown on Figure 2.

3.3.2 Emissions Trends. Figures 3-a through 3-d show Massport (EIS) projections of Logan emissions assuming that the airside improvements including the construction of a new runway take place in 1999.[10]

- The Massport projections clearly show a significant increase in emissions for all of the pollutants (NOx, VOC's, CO and PM10) from 1999 to 2010 with Massport's upper projection of *45 million passengers*. The projected increase for NOx is 46 %.

- For the *37.5 million passenger* 2010 projection, NOx (26% increase) and PM10 (6 % increase). For CO and VOC projected emissions decline slightly.

The projected increase in NOx emissions is associated with projected growth in aircraft operations (and ground-level sources) at Logan and to a shift towards new engines with higher NOx emissions.

3.3.3 New Aircraft Engines: Less noise, more NOx. One of the principal measures being touted as a way to reduce noise will ironically work to increase NOx emissions. As Massport acknowledges (EIS 6-73), increased NOx emissions are "an *unavoidable consequence* of phasing in quieter, more fuel efficient engines." While it states that manufacturers are researching ways to reduce NOx emissions, Massport isn't making any promises.

4.0 The Airport, Smog and Ozone. One of the most glaring deficiencies of the EIS is its failure to address the potential impact of emission trends, the associated airport expansion will affect the region's serious ground-level ozone problem.

4.1 Background on photochemical smog and ozone. Box 1 describes how emissions of hydrocarbons and NOx react in the presence of sunlight to form a host of secondary pollutants known collectively as "photochemical smog." The Clean Air Act regulates photochemical smog in terms of the concentration of ground-level ozone. Box 2 summarizes the health and environmental effects of ground-level ozone.

Note that ozone is a regional and not merely local problem; emissions from the airport and aircraft entering the region to use the airport will affect neighborhoods tens of miles from Logan. (See Box 1).

BOX 1. FORMATION OF PHOTOCHEMICAL SMOG / GROUND-LEVEL OZONE.

Photochemistry. Many stationary sources (e.g., factories, power plants) and mobile sources (aircraft, motor vehicles) emit hydrocarbons (e.g., fuels that volatilize) and oxides of nitrogen (NOx). These pollutants, when exposed to sunlight, undergo a very complicated chemistry. The products of the chemistry include irritating gases (e.g., N02 and ozone) and fine particulates that contribute to summertime haze -- the tell-tale sign that the atmosphere is photochemically active.

- Photo-chemical smog, including ground-level ozone, is primarily a warm-season phenomena. The atmosphere reactions are hastened by sunlight and warmer temperatures.

- The distribution of smog is complicated by the fact that freshly emitted NOx can scavenge ozone and reduce its concentration in potent source regions. However, as an urban airmass moves downwind the ozone levels tend to increase -- with highest levels often occurring in suburbs, exhurbs or in rural areas tens of miles from ubran sources.

Ozone - a regional problem. The levels of ozone and other smog constituents are the cumulative product of a myriad of stationary and mobile sources. In fact, highest levels of ozone are often found tens of miles downwind of the most potent urban source regions; this occurs because the precursor pollutants continue to react and form ozone as they move downwind from concentrated source regions.

BOX 2. HEALTH AND ENVIRONMENTAL EFFECTS OF GROUND-LEVEL OZONE

Ozone acts as a powerful respiratory irritant at levels found in Massachusetts during the summer. Exposure to ozone may lead to shortness of breath, wheezing and coughing, and chest pain.

Long-term, repeated exposure to elevated levels of ozone may lead to large reduction in lung function, inflammation of lung lining and increased respiratory discomfort.

According to EPA several groups of people who are at particular risk from high ozone levels:

- people with pre-existing respiratory disease (e.g. asthma, chronic bronchitis, emphysema)
- individuals who exercise outdoors
- people who have a particular sensitivity to ozone.

Children. According to the American Lung Association, children are particularly vulnerable to elevated ozone.

- They spend more time engaged in vigorous outdoor activity and have higher breathing rates
- They have narrower airways than do adults and can experience serious obstructions.
- Air pollution including ozone, can result in more frequent respiratory infections in childhood and increased risk of reduced lung function later in life.

Source: American Lung Association, 1996, Health Effects of Outdoor Air Pollution.

Farms, Ecosystems, Materials. Ozone harms crops and natural vegetation more than any other air pollutant.* The crop loss in the U.S. from ozone has been estimated at several billion dollars.** Ozone also causes widespread damage to a variety of materials including paints, and rubber.

Sources: *US EPA, Air Quality Criteria for Ozone and other Photochemical Oxidants, Vol. 3.
**US EPA, Air Quality and Emissions Trends, 1993, p. 9.

4.2 Logan and Ozone. The EIS's paucity of analysis of the connection between Logan Airport on ozone is especially significant given that:

- Aircraft, airports, and the motor vehicle traffic they attract are major sources of hydrocarbons and oxides of nitrogen (NOx), both are essential ingredients (precursors) for the formation of photochemical smog.

- All of Massachusetts has been designated by U.S. as being non-attainment areas for ozone. More than 5.5 million people live in the Boston-Lawrence-Worster area is (Eastern Massachusetts) characterized by EPA as a "serious" non-attainment zone.[11]

- MADEP evidence shows that a larger number of areas and people are incorporated in the area in which the new more protective ozone standard (state standard) is exceeded. Thus, additional precursor reductions may be needed to fully protect public health.

- Elevated ground-level ozone concentrations cause respiratory impairment and illness -- especially in children and people with chronic respiratory conditions such as asthma and bronchitis (See Box 2).

- Massport projects a 26% to 46 % increase in Logan Airport NOx smog precursors by the year 2010. (See Section 2.0)

- The EIS contains evidence indicating that the particular class of volatile organic compounds that contribute to smog and ozone formation will increase due to airport expansion. The EIS (Tables also shows a 6% to 29 % increase in modeled concentrations for those hydrocarbons which are photochemically active (described as ozone indicator VOC's in the EIS).

The Massachusetts Department of Environmental Protection (MADEP) has raised concerns about Logan Airport's projected increases in ozone precursors given the state's region's serious non-attainment status for ozone. A MADEP environmental review stated the following

> " ...In 1995, Massachusetts capped NOx emissions at 35% of the 1990 levels from sources greater than 15 MW or 250 mmBtu/hr heat input. A comparison of Logan NOx emissions projected for 1999 indicates that Logan's NOx emissions are comparable to some to the larger sources included in the Massachusetts NOx Allowance Program. In fact, Logan would rank sixth after the largest utility units in a list of 38 applicable units." [12]

In its December 1997 Certificate on the Generic Environmental Impact Report, MADEP recommended the development of air emissions caps and/or an emissions offset program.[13]

4.3 Massport's side-steps the ozone issue. Massport's February 1999 Environmental Impact Statement says almost nothing about the impact of Logan emissions on ozone. With a single paragraph it waves away all regulatory concerns:

> "Based on the results of the emission inventories and the dispersion modeling, the following findings on the effects of the Airside Project alternatives are evident: (1) there are no predicted violations of any State and Federal standards or guidelines under any future scenarios or alternatives; and (2) the overall impacts associated with the Airside Project Alternatives are beneficial or will remain imperceptible." (p. 6-84)

The modeling technique used in the EIS does not incorporate atmospheric chemistry and makes no estimates of the impact of precursor emissions on ozone. The indirect measure used, "ozone indicator VOC's" (projected to increase in the future) is not directly comparable to the ozone standard. Thus, the EIS is deficient with regard to Logan Airport expansion on ozone concentrations; on its health impacts; or on its impact on attainment efforts. In addition, the model (see EIS p. 5-56) is limited to the immediate vicinity of the airport. In contrast, the maximum impact of precursor emissions on ozone is likely to be located many miles or tens of miles downwind from a source. That is why EPA recommends the use of urban airshed and regional models that incorporate both chemistry and transport. 117.28

The report also fails to assess how the increases in NOx projected for Logan Airport will affect the state's ability to meet the new and stricter 8-hour average standard of 0.08 ppm. The new standard, not mentioned in the EIS, will go into effect in the year 2000. Air monitoring data collected by the Massachusetts Department of Environmental Protection indicates that using the new standard places a much higher portion of the state's monitoring locations, counties and people in exceedance areas.

Massport has dismissed MADEP's recommendation for emission caps. It argues that such caps would not be enforceable "since the largest single source of air emissions, aircraft, are beyond Massport's control and most other sources such as tenant vehicles and activities are subject to only indirect influence by Massport." (Ref: Boston-Logan International Airport, 1997 Annual Update (EOEA #3247/5146), August 1998 -- Response to comment: C18.)

Although Massport has taken some steps to curtail non-aircraft emissions (e.g., a limited alternative fuel vehicle program), it has essentially embraced a future that embraces future growth that it acknowledges will result in significant increases in ozone precursors and other emissions.

5.0 The additional impacts of increased NOx emissions. Despite its projections for substantial increases in NOx emissions over the next decade, the EIS fails to address a number a critical issues associated with NOx. These are described below. 117.29

- NOx is an important precursor to acid rain. Acid rain affects both terrestrial and aquatic ecosystems, e.g., acidification of waters, reduction in fish populations, damage to forests and wildlife, and damage to soils, materials, monuments and buildings.[14]

- NOx emissions to the atmosphere are an important source of nitrate deposition to coastal waters. Nitrate deposition contributes to the over-fertilization or nitrification of bays and estuaries; this in turn contributes to algae blooms that can choke off aquatic life by limiting both light and oxygen.[15]

- NOx emissions may also form secondary particulate matter,[16] which can impact the respiratory system (see Section 6).

6.0 Particulate emissions. As stated in Section 3, all of the Massport projections show significant increases in PM10 emissions (particulates with diameters less than 10 microns) between 1999 and 2010. However, the EIS all but neglects to discuss the significance of increased particulate emissions. Particularly important are the smallest particulates, those with diameters less than 2.5 microns (PM2.5). Scientific studies over the past decade indicate that this smallest class of particles are largely responsible for the most serious health effects and for haze which restricts visibility. These fine particulates penetrate deep into the lungs and adverse effects include lung cancer, asthma attacks, chronic obstructive pulmonary disease and restricted activity due to illness.[17] PM2.5 has especially severe effects on children with asthma.[18] EPA has recognized the importance of PM2.5 by adopting new particulate standards based on this measurement.

The EIS projects that PM10 emissions will increase by as much as 29 % over the next decade. The EIS (p. 6-77) acknowledges that aircraft are the dominant source of particulate emissions, representing roughly 90 percent of the Logan total and that "emissions of particulate matter are expected to increase in future years in connection with the forecasted increase in aircraft operations at Logan." However, the EIS falls short in a number of ways:

- The EIS fails to present evidence on the particle size distribution of particles emitted from aircraft. While the PM2.5 ambient air standard is not yet being enforced, the EIS should show estimated projections for emissions of these particles since they have the most devastating impact on health.

117.30

- The EIS should also consider how this particle size distribution is modified as it moves through the urban atmosphere. Mathematical models of particle size distribution in urban air predict that the mass of particles in the range of 0.1 - 1.0 microns should be equal to the mass of particles in the 1.0 - 10 micron range.[19] If this is the case, than a major portion of mass of PM10 should be comprised of particles in the PM2.5 range. This is important because modeled and measured PM10 annual concentrations in neighborhoods close to the airport are in the 20-24 ug/m^3 although within the PM10 standard exceeds the PM2.5 standard of 15 ug/m^3. Thus, it is possible that residents of

the Logan vicinity are breathing air that is unhealthy with regard to the smallest class of particles. The EIS needs to examine this possibility.

- The EIS is also deficient in that it's discussion of particulates neglects particulates formed from NOx and other primary emissions. As noted previously, NOx emissions are also forecast to rise with increasing aircraft operations.

7.0 Hazardous air emissions. The EIS fails to consider the environmental impact of non-criteria contaminants, including Hazardous Air Pollutants (HAPs), including benzene an established human carcinogen. One cannot make an adequate assessment of the health impact of these chemicals by lumping them into a single category such as volatile organic compounds or hydrocarbons. Airports are a major source of benzene emissions in urban areas and continued expansion may lead to increased emissions of these hazardous air pollutants (the EIS shows an increase in total VOC emissions for the 45 million scenario from 1999 to 2010).

An 1993 EPA-sponsored study evaluated cancer risks attributable to all air pollution sources in southwestern Chicago. The study found that aircraft flying in and out of Midway Airport represent a substantial source of particulate matter as well as hazardous air pollutants such as benzene, 1,3-butadiene, and formaldehyde. The study found that despite Midway's small size (handling only about 10 percent of Logan's passenger volume) it emitted far greater quantities of hazardous air pollutants than industrial sources within the 16-square mile study area.[20]

- The 1993 EPA study found that 10.5 per cent of the cancer cases associated with HAPs were attributed aircraft emissions. This number does not include additional contributions associated with airport vehicles and motor vehicle traffic associated with the airport. The study found that cars, buses, and trucks in the study area (not all attributable to the airport) were the most important contributors of cancer-causing air emissions (25 percent of cancer cases associated with HAPs).

- The authors of the study state: "it is no surprise that emissions from aircraft engines may have significant impact on people living in the study area, especially to people living at receptors [locations] adjacent to the airport." [Emphasis added].

The Logan EIS presents no information on hazardous air pollutants and their potential impact on cancer rates in surrounding communities. However, Logan is a much bigger airport than Midway and may be reasonably expected to have larger hazardous air pollutant emissions. 117.31

8.0 Traffic Congestion and Air Emissions. The EIS does not sufficiently address the impact of its projected expansion rates on airport traffic. It needs to present an analysis aimed at assessing the impact of increased congestion with worst as well as best case assumptions on measures to mitigate auto traffic (public transit use, HOV lanes etc.). The shear optimism in EIS's forecast is shown in Table 4-4 of the Annual Update for 1997. 117.32

This table shows a 29 percent growth in passengers using the airport between 1999 and 2010 (assuming 37.5 million passengers in 2010). For the same period the Update shows only a 12.3 percent increase in the rate of average annual weekday traffic (AWDT) using the airport.

The problem is that Massport's projections are at odds with the historical relationships between AWDT and passenger levels. Over the past five years, the rate of growth of AWDT has been nearly twice as high as the rate of growth of passengers. The EIS fails to explain how it will manage to reverse the historical relationship. Even with a 1:1 ratio of AWDT to passenger growth, average daily traffic volume would reach nearly 130,000 cars by 2010 for the 37.5 million passengers and nearly 156,000 for the 45 million passenger scenario. Whereas Massport projects an addition of about 12,000 cars per day over the next decade, recent history suggests that the airport and roadways will have to accommodate from 30,000 to 50,000 cars or higher. This indicates that Massport's projected air emissions from motor vehicles may be significantly underestimated.

9.0 Balanced Regional Transportation Plan. The EIS preferred alternative is clearly a capacity enhancement that will help Massport achieve the growth rates that it projects as inevitable. The EIS fails to develop a regional transportation plan as a serious alternative to a new runway and continued expansion. Thus, the EIS cannot be considered to be complete. 117.33

Logan currently handles about two-thirds of the passenger enplanements in New England. The impact of this airport on the environment, public health, and quality of life is concentrated on the most densely populated area of New England. Expansion can only mean greater intrusion in the future. The EIS should develop a preferred regional transportation plan alternative that would focus on expanding the use of energy efficient inter-city rail would promote a regionally balanced spread of airport use. This plan would be specifically designed to reduce noise and pollution levels in the neighborhoods surrounding Logan Airport in the next decade.

ENDNOTES:

[1] In a 1993 NRDC survey, Logan was ranked number 12 in terms of numbers of passengers.

[3] Consultants to the Community Advisory Committee (CAC), Review Comments on Draft Environmental Impact Report, DEIS/DEIR, for the Logan Airside Improvements Planning Project, Feb. 1999. According to this document: the construction of the runway may not increase peak hour capacity, but will provide controllers with the opportunity to increase throughput by using higher-capacity configurations more of the time. While the stated purpose of the new runway is to reduce weather-related delays, the new runway would also increase the all-weather capacity of the airport. Notably, Massport's has not included in its preferred alternative an option for "peak hour pricing" which acts to manage rather than to invite new capacity.

[8] Lipman, S. G., Department of Environmental Protection's consolidated comments on Logan Airport, Nov. 24, 1997.

[9] The NOx emission estimates contained in GEIR and EIS tend to underestimate the full extent of NOx emissions because the conventional practices is to include only those aircraft emissions which are emitted at ground-level and in the first 3,000 feet of take-offs and landings. However, NOx emitted at higher levels can contribute to a number of environmental problems including regional and long-range transport associated with multi-day ozone episodes, acid rain, and nitrate deposition.

[10] The EIS projects two emissions scenarios for each passenger growth projection -- "high" and "low." The low projection assumes more jets and larger aircraft, but has a lower number of flight operation, relative to the "high" operations scenarios. In the following section we used the "high" operations scenario to track emissions levels.

Fuel storage/handling	0	0	381
Miscellaneous sources+	37	244	6
Total other sources	37	244	387
Total airport sources	**14,640**	**5,726**	**3,183**

** Includes vehicles converted to alternative fuels

*** Includes through traffic from the Ted Williams Tunnel

Note: Particulate (PM10) emissions for the above source categories were not provided in the Source document.

Source: Boston-Logan International Airport, 1997 Annual Update (EOEA #3247/5146), August 1998

Lauri Webster, East Boston

"Sometimes the noise is so bad my husband and I pack the house and leave, just because we can't take the noise any more. It's pathetic-I can't even stay in my own house.

"The blast of the engines crescendos to 95 decibels every 90 seconds as each plane takes off. The screeching and squealing makes me clench my teeth. Each plane thunders down the runway, shaking the windows of the house, vibrating china in the closet and tilting pictures on the wall.

"The noise wakes us up early in the morning and pounds away while we get ready for work. Every night it destroys the peace when we come home from a long day. It makes me irritable and I snap at my three year old. And sometimes this noise goes on for days-sometimes weeks-without a break.

"When the wind changes and peace returns to my neighborhood, it is delightful. Unfortunately, I know that the planes are torturing friends in other neighborhoods and surrounding cities and towns.

"The smell of jet fuel smell knows no boundaries either. It hits me in the face the second the train doors open at Orient Heights T station, and follows me up the hill as I walk home. I can't always escape it once I get inside either, even if I put my head under a pillow.

"I wish I could feel good about this airport expansion project, but I do not. I believe that air travel is still in its infancy, and that everything about it is going to get bigger and faster, and there is going to be more of it. It seems like we ought to be defining some boundaries and setting some limits, like a parent does for a child. One region can only take so much."

Dovi Abbey, Roxbury

"The sleep deprivation is terrible. There are times when I have five consecutive days of planes over my house, going as late as two or three a.m. and starting as early as six in the morning. After five days of that you feel like you're in a war zone. They're turning Boston into Baghdad."

Martha Merson, Jamaica Plain
"My neighborhood has an active Crime Watch. We have organized to get rid of a drug problem, and if we had a truck load of garbage delivered to our street, we would find a way to clean that up too. But the kind of pollution Massport is planning to direct our way can't be contained. It has to be stopped before it starts.

"The people of Boston have done so much work to make our neighborhoods livable; we don't need Massport to turn them into a war zone."

Alan Wright, Roslindale
"I live next to the Arnold Arboretum, a sanctuary in the city. Noisy flights coming off Runway 27 make it unbearable already. Runway 14/23 will triple the overflights and ruin the Arboretum for all our citizens. Massport should restrict or ban older jets, in addition to developing a quality of life master plan for the region. "

117.34

Barbara Flavin, Winthrop
"Honestly, my dream is just to be able to go to bed early, sleep through the night, and wake up late. Due to Logan Airport and the planes, I am unable to do that."

Rebecca Swope, Chelsea
"I'm a first-time homebuyer. I've lived in Chelsea all my life and finally got the money for a home on Tudor Street. I'm doing it all over, but now in my new house I get woken up at two or three in the morning. I can't get any sleep at night!

"I fall asleep during the day. It's been so bad that I'm thinking about moving out of my own home. I never had tension headaches before, but I do now-all thanks to Massport."

Ian McGlocklin, Brookline
"Pollution is becoming an increasingly vital issue for people's health today. More runways mean more plane traffic which means more pollution and greater environmental damage. When will it stop? It should now!" 117.35

Brian Monk, Back Bay
"I'm a college student and can only afford cheap housing. Because of this, my apartment walls are very thin and I hear the "T' and the airport noise all night long, so it's difficult to sleep."

Dave Prusky, Chelsea
"I'm over 60 and retired. I'd like to live out my life in peace and quiet, but Massport's got different plans. The planes are so low over my house that if I were to throw a rock, I could hit one. I'm already partially deaf in my right ear, and I attribute this to having airplanes overhead all the time.

"In my neighborhood, we get a lot of small plane noise. Why is it that I have to pay for an HOV lane on the Southeast Expressway that I can't use, but Massport says it can't limit puddle jumpers' access to Logan? Why not an "HOV airport?" 117.36

Tom Briand, East Boston

"My family has lived in East Boston longer than the airport has been here: over one hundred years. We live in the city-and we love the living in the city-so we expect some noise and traffic. But the growth of Logan is swallowing up a community that has already suffered too much from Logan's expansion. This is our community. This is our neighborhood. This is where we want to raise our kids. Enough is just enough."

Davida Andelman, Dorchester
"Over the last year or so, I've noticed that the noise from Logan over Dorchester has gotten dramatically worse: early in the morning, early in the evening and late at night. It disturbs me when I'm listening to the six o'clock news, when I'm trying to go to sleep, and in the morning when I might want to sleep later. This interferes with my quality of life.

"This is the one issue that can unify all of Boston's neighborhoods. I go to a ton of community groups and meetings, and I haven't heard one person say they think Logan needs another runway."

Robert Massa, Winthrop
"We've lived in the same house for 32 years, and during that time we've had two dogs that have spent most of their time outside in our yard. The first one went deaf at age twelve, and now our current dog is deaf also. If the noise did that to our pets, what's it doing to us?"

Richard Salini, East Boston
"One of Massport's contractors wanted to dump a load of contaminated dirt on the park near my house. It's a great park. I said, you are not putting that dirt on our park. They said, yes we are. Massport would have allowed it to happen too, if our community meeting hadn't stopped them.

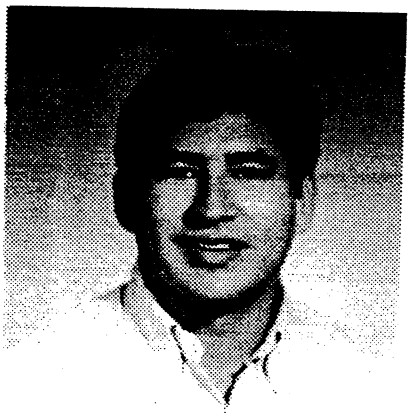
117.37

"Why does Massport calculate the value of passengers' time lost to delays, but ignore the economic costs Logan imposes every day on its neighbors? Every time I drive, I hit traffic associated with the airport, wasting gas, and the aircraft exhaust that covers my car forces me to get my car washed constantly. At home, I have to keep my windows closed year-round, requiring me to keep the air conditioning running all summer long. These add up to hundreds of dollars a year in extra costs due to the airport that I must pay out of my own pocket."

Ignacio Ochoa, East Boston

"I moved from Guatemala to East Boston five years ago. I like East Boston because it is a friendly, safe, ethnically diverse and affordable community that is very convenient to downtown. My wife and I bought a house on Eagle Hill and have worked very hard to renovate it. As soon as we moved in we realized that it is under the flight path of Runway 33.

"Planes wake us up at 6 a.m. and fly continuously (a plane every 1 to 3 minutes) all day and into the night-often past one in the morning. Besides the planes that fly over us we hear the constant ground noise of planes preparing to take off and land. The planes line up one after the next and the background roar never stops. 117.38



"My wife called the Massport soundproofing program and they sent us a blurry map with no street names and a letter telling us that we did not qualify for sound proofing. Massport says our home lies four houses away from the noise contour lines which Massport presently utilizes.

"Because of Logan, East Boston's air quality violates the Federal Clean Air Act and we have some of the highest rates of respiratory infections in the state. How can Massport advocate building a runway that will triple the amount of planes going over our home? Regional planning-not runway expansion-should be implemented immediately. What is Massport's plan to help abutters live with the present noise and contamination? 117.39 117.40 117.41

"In Guatemala, human rights abuses are common. Development projects with undesirable impacts-garbage dumps, toxic waste sites and highways-are always built next to working class communities. In Guatemala, if we speak out against unfair policies and development projects we risk imprisonment or death. But justice is supposed to prevail in the United States, even when the interests of working-class and minority people conflict with the profit interests of big businesses. For this reason, I am a member of Communities Against Runway Expansion (CARE), and am speaking out in the hope that Runway 14/32 will never be built."

Lolly Lincoln, Cambridge
"I live in Cambridgeport and now that I'm home with my kids I'm really aware of the airport, because we get a lot of small planes with really loud engines. My one year old son's bedroom is under the eaves, and the noise has woken him up many times. On nights when the wind is from the east, I hear them one after another. Some days it's relentless, and even the china cabinet shakes.

"I'm also concerned about the air pollution from the planes overhead. Is anyone thinking about the effects of that?"

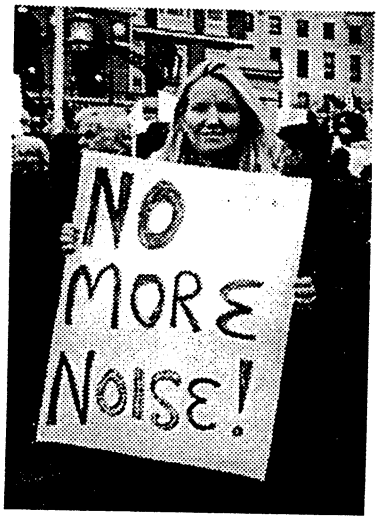
117.42

Pauline Collins, Hull
"I live on a hill in Hull and can see the planes going by my windows. My whole house shakes. I oppose the pollution-noise and chemical-that Logan currently generates, so we certainly don't need more runways at the airport. We need a regional plan to save the neighborhoods around Boston Harbor."

Art Flavin, Winthrop
"Now that I'm retired, I should be able to choose when I'm going to work and when I'm going to rest. However, Logan airport makes sure that I wake up by 6:30 in the morning and that I not go to sleep before 11:30 at night. Naps are out of the question. But according to Massport, the neighborhood should be serene because the so-called average noise level is well within their limits.

"Last spring, we had a meeting last spring with Massport and FAA to discuss quality of life issues and we couldn't hear ourselves speak. Winthrop town hall is a brick and granite building but it was a hot night and we had the door open. It was either leave the door open and be drowned out by the airplane noise, or have our meeting but roast in the heat.

"In theory, my own house isn't supposed to be under any flight path, but when the wind is blowing a certain way, I can't even use my front porch."



Madeleine Steczynski, East Boston
"I have lived in East Boston for eight years. In my time here I have learned what incredible struggles the residents of this neighborhood have had to go through. My opposition to the runway is based on two facts:

"Planes flying over my house at night have been so loud that I awake and think we are at war. Car alarms throughout the entire neighborhood have been set off.

"Also, I work with the kids of East Boston. They deserve a better future!"

Mary Thawley, South End

"Sixty thousand jets over the South End are going to cause air pollution and if they want to fly any lower, there'll be no quality of life. You'll be able to grasp the wing and hitch a ride."

117.43

Gregory Curci, Winthrop
"Eight years ago when I moved into my house in Winthrop, I could hear the airport, but now with the increase in air travel I can also smell the jet fuel, and tires burning from the landings. I'm not supposed to be under any flight path, but there are times when I see three planes crossing simultaneously over my house at different altitudes.

117.44

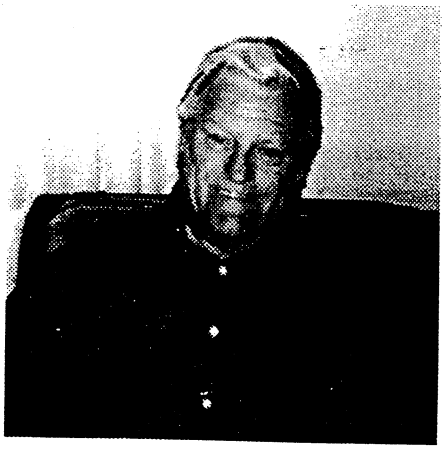
"I'm also starting to get smoke from the airport which hadn't happened before. So my home is no longer safe from the impact of the Logan."

Susan Horn, East Boston
"My sister has asthma, my mother has asthma. Now I have asthma. It makes you wonder that of a family who grew up in the same house near the airport, at least three of us have gotten asthma."

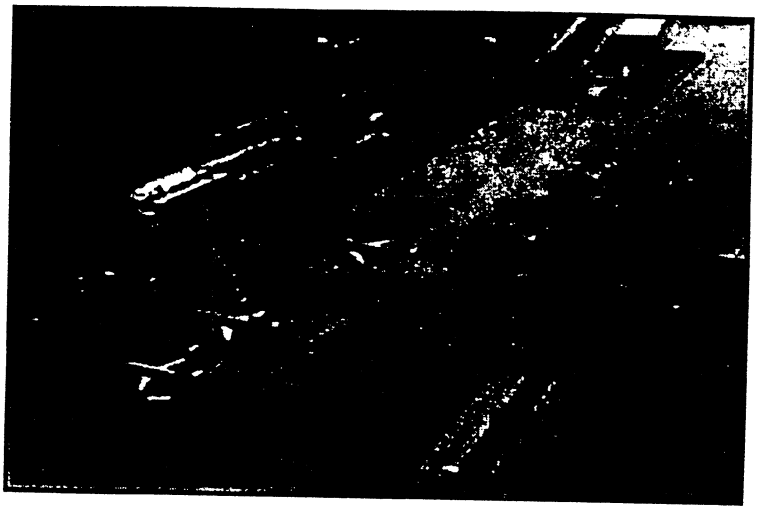
117.45

Bobbie Horn, East Boston
"I've lived in this house almost my entire life. This is a nice place to live-except for the airport. We have soundproofing but it doesn't really improve your quality of life; it just takes the edge off. And already we've had to replace more than a dozen of those windows that have broken. The noise is so bad that the day before I had a party for my daughter, I was actually hoping it would be cold so there'd be a reason to keep the windows closed.

"Sometimes the planes come in so low they clip the treetops. The worst was a day several years ago when they brought the planes in just barely skimming over our roofs. It was so frightening that everybody around here ran out of their houses. "



Arthur Horn, East Boston
"My big problem with Massport is their credibility. They tell you one thing, then they try to do another. They bend the rules when they need to, and obey them only when it's convenient. So when Massport tells people in the Bayswater Street area that 14/32 will cut the traffic over us, it may-for a brief a time. But as soon as air traffic grows enough, they'll send the planes back to us, and at even higher levels."



AIRSIDE IMPROVEMENT PROJECT

A DRAFT ENVIRONMENTAL IMPACT ANALYSIS

By

Peter Alachi, MS, Biology
palachi@lynx.neu.edu

Monday, April 19, 1999

SUMMARY OF MASSPORT'S AIRSIDE IMPROVEMENT PLANNING PROJECT

The Draft Environmental Impact Statement and Draft Environmental Impact Report (Draft EIS/EIR) considers the impact of five options on flight-delay reduction and weighs the environmental impact of each. The proposed schemes, called actions in draft report, comprise:

- Constructing and operating a 5,000-foot unidirectional runway (14/32) located at the southwestern edge of the airport for use over the water only. The runway length was selected over a 4,500-foot length in order to accommodate a greater proportion of the regional/commuter carrier fleet and therefore more effective in reducing delay (I:3-1).
- Constructing and operating a 9,300-foot Centerfield Taxiway between runway 4L/22R and 4R/22L.
- Reconfiguring, improving, realigning and extending other Taxiways
- Reducing approach minimums on some runways (15R, 22L, 27 and 33L) by providing precision approach guidance to a point closer to runway touchdown. This will reduce delays and enhance operational safety.
- Peak Period Pricing or landing fee surcharges imposed on carriers during peak flight activity levels and as a result of airline over-scheduling.

The planned project was picked from a list of 5 options or alternatives (I:ES-16 - Table 1).

TABLE 1 - SELECTION OF PROPOSED ACTIONS AND DELAY REDUCTION

Alternative	Proposed Action	Percent Reduction of Delay for Year 2010 per 37.5M Passengers (Low Fleet)	Percent Reduction of Delays for Year 2010 per 37.5M Passengers (High Fleet)	Status
1	All actions	-34.1%	-53.6%	Rejected
1A	All actions without Peak Period Pricing	-29.9%	-31.3%	Accepted
2	All actions without 14/32	-14.1%	-42.7%	Rejected
3	All actions (operational and administrative) but no build	-10.3%	-41.3%	Rejected
4	No actions - allows routine maintenance and annual minor improvements	-	-	Rejected

* Based on table 4.5-2 (I:4-30) and bar graph figure ES-4 (I:ES-19).

Peak Period Pricing was not considered since current flight activity levels and over-scheduling do not exceed current airfield capacity (I:3-39).

Construction traffic during the 2000-2004 period will generate a daily average of 129 (ES:ES-27) truck round trips (range 58-580/day). Routes 1A and the Ted Williams Tunnel will be used as the major gateways. Certain designated routes on State highways would "minimize the impact on local streets" (I:ES-29).

Runway 14/32 would be permitted to operate as a unidirectional runway with all arrivals and departures occurring over B ɔston Harbor. As a result 15% of total airport operations would shift from flight paths over communities to flight paths over the water (I:ES-4). Upon completion, the project will reduce impacts for the most severely noise-affected communities in East Boston, Revere and Winthrop (I:ES-30).

SUMMARY OF PROJECT ENVIRONMENTAL DATA

Logan Airside Improvements Planning Project (EOEA #10458) looked at 2 areas:

- Addressing Logan's delay problem
- Enhancing safety

The two plans will be achieved with *minimal* environmental impact (I:ES-5 - Table 2).

TABLE 2 - SUMMARY OF DRAFT EIS/EIR 'S ENVIRONMENTAL IMPACT AND MITIGATION

ISSUE	DRAFT EIS/EIR STATEMENT
Noise	1. 14/32 will provide more equitable noise distribution and mitigation measures to most affected communities. 2. Communities at 65 decibels will experience a noise increase of 2%. Soundproofing will be provided. 3. Proposed plan will not affect normal activity or aesthetic value of a public park, refuge or historic sites. 4. The Taxiway system will reduce ground noise.
Air Quality/Odors	1. Air quality will improve due to 14/32 added shorter delay periods, and the Taxiway system. 2. Ambient levels of Carbon Monoxide, Nitrogen Dioxide, and volatile Organic Compounds are expected to be well within the air quality standards and are below of all considered alternatives.
Terrestrial Vegetation and Wildlife Habitat	The runway and taxiway constructions will result in the total loss of 39.4 acres of vegetation, leaving behind a total of 440 acres. See also Table 5.4-1 (I:5-60) for a list of avian species within the Logan airfield.
Endangered and Threatened Species of Flora and Fauna	The construction of the Centerfield Taxiway between runways 4L/22R and 4R/22L will result in loss of upland sandpiper (Bartramia longicauda) habitat. A plan with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) will mitigate this impact.
Soils	The reportable concentrations of S1 and S2 soil categories were exceeded in some of the soil samples for arsenic, lead, and two polynuclear aromatic hydrocarbon compounds (I:5-71 and Table 5.6-1 - I:5-72)
Water Quality	Class SB water quality standards are being met under average conditions (Table 5.5-1 - I:5-66).
Wetlands	No federal or state wetlands occur within the airfield study area (I:5-58).
Construction Impact	The construction-related work will be alleviated through "initiatives to limit traffic, noise, and air quality impacts in surrounding communities."

RESPONSE NOTES

There are legitimate questions to be reckoned with as they pertain to nearby communities' expectations. Any Logan improvement should be done in a sensible manner that will not compromise the environment, impact further on our health, irreparably disrupt our lifestyles, or detract from our property values. The submitted report contains numerous deficiencies that fail to compare the benefits of alleviating delays and cutting airline costs to the true environmental, social, economic, and medical costs of the selected scenarios. This report weighs environmental and medical impacts as compared to delay impact.

• Noise Pollution Impact

1. One of the most frequent complaints of local communities' residents is noise. The FAA's threshold of 65 decibels does not accurately assess how many people are disturbed by aircraft noise. The National Resources Defense Council (NRDC) confirmed that Denver International Airport, despite the relatively few people living within its 65 decibel noise contour, receives the highest number of monthly noise complaints from outside this area[9]. Noise can cause serious health problems. It acts as a biological stressor by eliciting a response from the brain's reticular activation system that prepares the body for "fight or flight". Neural impulses then travel throughout the central nervous system and influence perceptual, motor, cognitive, behavioral, glandular, cardiovascular, and gastrointestinal functions. Therefore, noise is thought of as a *major* threat to human health[7]. 117.46

   The constant roar from jet aircraft can seriously affect the health and psychological well being of children, according to a Cornell University study[8]. Gary Evans, a professor of design and environmental analysis in Cornell's College of Human Ecology concluded that there are health problems resulting from chronic airport noise, including higher blood pressure and boosted levels of stress hormones, which may have lifelong effects. Evans contends also that New York children living near an international airport tended to be poor listeners and did not read as well as matched children in quiet schools. Mark Lawrence, an East Boston resident, who currently lives in Florida, recalls[13]:

   > "I REMEMBER being scared out of a deep sleep as a child as a jet would pass over my house so close you could see the pilot's face.
   > I REMEMBER how each year as a student all my teachers would have to pause every 5 or so minutes to allow the screeching jets to pass.
   > I REMEMBER not being able to concentrate in school because of jet noise."

   As many as 115 flights an hour pass over communities north and south of Logan Airport. In a joint public meeting by Massachusetts Environmental Protection Agency (MEPA) and the Federal EPA, Elaine McGrath of Chelsea told the board that, "The communities are speaking with one voice and telling you it's *unbearable*. Massport isn't telling you that"[19].

2. No remedy was given for the structural damage due to low-flying aircraft vibrating homes, school buildings, monuments, and industrial infrastructures within the affected communities. 117.47

3. The following flight path map obtained from the Boston Globe shows the projected impact comparing 1997, and 2001 with or without the new runway.

One obvious problem with this map's projections is that 14/32 will not be completed by 2001. According to a Massport spokesman, Jeremy Crockford, the approval process alone could take two years[20]. But a less obvious issue revolves around the increased fleet capacity projected by 2010. The numbers are therefore meaningless since those communities that are promised a relief for 2001 will not see it materialize in time and will be drowned by an eventual increase in total flights that supercedes the current level. Furthermore, if the plan is implemented, there will be a disproportionate and exorbitant increase in flights over poorer communities such as sections of Chelsea, East Boston, Everett, and Roxbury. The latter fact triggered U.S. Representative Joseph Moakley to argue that the impact statement did not address the environmental effects of the new runway on minority and low-income people in Boston that was required by a 1994 executive order issued by President Clinton[15]. 117.48

4. The Harbor Islands recreational area will suffer significant noise impact. 117.49

- ## Chemical Emission/Impact

Chemical pollutants emitted include cumulative chemicals generated by vehicles within the airport area, such as planes and transport vehicles, as well as road traffic leading to and from the airport.

1. Since the pollution emission predictor uses 1993 as a contrast item, an overcrowded airport year and a peak year for delays, the predicted emission reductions for year 2010 are undoubtedly minimized to favor a lesser environmental impact. Furthermore, the model predicts minor gains in reducing the levels of pollutants in the environment. But, the proposed action model predictor uses alternative 1 to attain this analytical profile (IV:Tables EI1-1-EI1-4). Since plan 1 was rejected in favor of plan 1A, these data do not necessarily fit the report's final conclusions (see Tables 1 and 3 in this report). 117.50 117.51

2. The additional combustion of gasoline and oil will increase the total Volatile Organic Compounds or Hydrocarbons (VOCs) in the atmosphere. VOCs are considered to be photochemical pollutants; a concentration of 3 ppm can result in 0.1 ppm of photochemical oxidants, a class of pollutants that includes both hydrocarbon and nitrogen derivatives. 117.52

3. The EPA's regional administrator stated that "... the number of passengers using the airport is projected almost to double current levels by 2010" (II:1). The projected increase in passenger volume to 45 million by 2010 will have an adverse effect on the local transportation and air quality by increasing the overall level of ozone in the airport region and on roads leading to the airport. Reducing ozone precursors, which includes nitrogen oxides is necessary to help the State attain the health standards for ground-level ozone (smog). Nitrogen dioxide (NO_2) is a pollutant that in concentrations as low as 0.25 ppm for one hour can blanket the horizon with reddish-brownish haze. Smog formation is initiated by the photochemical decomposition of NO_2 to NO + O. The resulting oxygen atoms then react with the more abundant species O_2 resulting in ozone (O_3). Oxygen atoms and Ozone molecules are also highly reactive with hydrocarbons, and a variety of products are eventually formed, including alcohols, ketones and aldehydes. The eye irritation, which is a familiar feature of photochemical smog, is due to the presence of compounds such as formaldehyde and acrolein. Both NO and NO_2 can also react directly with unsaturated hydrocarbons resulting in Methyl Nitrate and Peroxyacetyl Nitrate (PAN), both of which are powerful eye irritants[23]. 117.53

4. Local airport traffic will also add to the problem of Carbon Monoxide (CO) emission. CO is found at normal levels between 0.025-1 ppm. In major cities, it ranges from 10-50 ppm. CO reduces the ability of the blood to transport oxygen though the body. The resulting strain on the heart and lungs can be fatal. CO can also cause dizziness, blurred vision, and distorted perception of time. 117.54

5. Sulfur Oxides, which occur chiefly as Sulfur Dioxide, Sulfur Trioxides, Sulfurous and Sulfuric Acids, can damage vegetation, fabrics, metals, and ecosystems such as lakes and ponds. Levels of 0.25 ppm or above cause irritation to human beings. Concentrations between 0.08 and 0.1 ppm for any length of time are considered unhealthy. It takes usually about 5 ppm of SO_2 for 1 hour to cause irritation to human throat and lung tissue, with accompanying bronchial constriction. But in individuals who suffer from chronic respiratory diseases, a minor increase in the concentration of SO_2 from 0.1 to 0.2 ppm can cause them to start coughing and experience severe difficulties in breathing[23]. Sulfur Dioxide is a heavy

noxious gas that can very quickly combine with water to form Sulfurous Acid (H_2SO_3). Also, Sulfur dioxide can absorb a photon of light and becomes "excited" so that if it collides with an O_2 molecule, it forms sulfur trioxide (SO_3). This is much more toxic than SO_2 and has much more affinity to water molecules in the atmosphere or lungs where it forms Sulfuric Acid (H_2SO_4), a highly corrosive acid. SO_2 emissions were not conducted since, according to the draft report, airports are not identified as significant sources of these emissions (I:6-64).

6. In addition, Sulfur compounds, Nitrogen Oxides, Lead, and various reactive volatile hydrocarbons can form other chemical complexes that are deleterious to all forms of life. These forms include a barrage of toxic and synthetic compounds whose effect on health ranges from clear-cut to suspicious. For example, NO_2 can combine with reactive hydrocarbons to form a wide range of pollutants including PAN, a major reactive pollutant. Some of these compounds are mutagenic and lead to cancer. Substances known to be cardiovascular irritants can directly be linked to emphysema, asthma, chronic bronchitis and heart attacks.

7. Suspended particles or particulates are tiny bits of matter (technically less than 0.1 millimeter) floating in the atmosphere, such as diesel smoke, fine ash, and dust. Particles which are smaller than 2.5 thousandths of a millimeter can pass through the primary, non-specific immune defenses such as nose hair and mucous membranes and may cause illness. Over a period of years, these materials attack lung tissue and increase susceptibility to such diseases as tuberculosis and lung cancer. And in urban areas, these particulates are believed to be responsible for increased asthma attacks, aggravating existing heart and lung conditions, lowering resistance to infection, and breathing problems in children. There is a direct correlation between high particulate air pollution and risk of premature mortality from heart and lung disease. The NRDC estimates that at current levels of pollution, approximately 64,000 premature deaths from cardiopulmonary causes may be attributable to particulate air pollution each year. That represents 6.5% of all cardiopulmonary deaths, which total 986,000 per year[9].

8. Many suspended particles serve as niche sites for microorganisms and their spores, including potential human pathogens.

9. High concentrations of suspended particles can cause reduced visibility caused by absorption and scattering of light. Soiled clothing and soot-covered buildings are other symptoms that are all too familiar.

10. Mixtures of atmospheric pollutants may show synergistic interactions, so that more aggregate damage is done by even small amounts than otherwise be expected. For example, the growth of pasture grasses is suppressed more by a mixture of SO_2 and NO_2 than by that of either alone[1].

11. Benzene, dioxin, toluene, xylene, and formaldehyde are known to be toxic and carcinogenic even at minute concentrations. None were monitored individually in the draft EIS/EIR study. 117.55

12. Overall health problems due to noise and chemical pollution include mental health problems, cardiovascular disease, gastrointestinal disease, compromised immune response, pregnancy and birth defects, learning disabilities, respiratory problems, and cancer[7].

13. Table 5.6-1 (I:5-72) indicates that the reportable concentrations of S1 and S2 soil were exceeded in some of the soil samples for arsenic, lead, and two polynuclear aromatic hydrocarbon compounds (I:5-71). Lead is known to be toxic in trace amounts. S1 soil category applies to those soils where there is a chance for a high frequency and high intensity of exposure to the soil by children and adults. While most of the lead assimilated comes from food and drink, some is inhaled. The residence time of lead in the bones is 78 years, whereas that of blood and soft tissue is about 30 days[6]. Lead emissions were not assessed by the draft report (I:6-64). 117.56

Ultimately, the lack of sufficient epidemiological and long-term health impact analysis due to these pollutants on people in affected communities is troubling.

TABLE 3 - COMPARISON OF DRAFT EIS/EIR ESTIMATES OF MAJOR AIR POLLUTANTS

Pollutant	Total 1993 Levels of Baseline Emissions for Logan (kg/day)	Predicted Low-Levels for 2010 (Alt 4/No Action)	Predicted Low-Levels for 2010 (Alt 1 - All Actions)*	% change from 1993 Levels with No Action (Alt. 4)†	% change from 1993 Levels with Action (Alt. 1)†
Carbon Monoxide	16,043	14,355	13,976	-10.5%	-12.9%
Sulfur Oxides	N/A	N/A	N/A	N/A	N/A
VOC	3,666	2,572	2,383	-29.8%	-35%
Nitrogen Oxides	5,002	7,078	6,919	+41.5%	+38.3%
Particulate Matter	241	280	251	+16.2%	+4.2%
Lead	N/A	N/A	N/A	N/A	N/A

* No data was given for the actual project (Alt. 1A)
† Negative data indicate a decrease in pollutant level while positive data indicate an increase.

- Construction Impact

1. The report claims no more than 0.6% overall impact on daily traffic due to trucking to and from the airport construction sites (I:ES-29). But the use of Routes 1A and the Ted Williams Tunnel will surely exceed that limit as hundreds of daily trucks enter and exit these roads. Furthermore, as to what roads are these trucks using to get to the aforementioned gateways, the report purports that 'certain' designated routes on state highways should be used to 'minimize' the impact on local streets (I:ES-29).

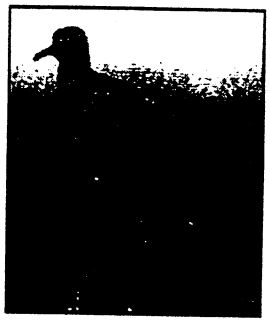
2. The draft report maintains that construction period traffic during the 2000-2004 period will generate a daily average of 129 truck round trips (range 58-580/day). The expected increase in traffic load will go on for years and will add to the already overly congested roads that lead to and from the airport. This will disrupt the normal flow of traffic on affected roads causing traffic delays, increasing traffic noise to neighboring communities as well as augmenting the existing pollution and particulate dust problem, and contributing to road erosion and structural damage. Nighttime construction will also occur. Winthrop's Office of the Board of Selectmen noted in a letter to Secretary Trudy Coxe, the Executive Officer 117.57

of Environmental Affairs, that "Past experience with other Logan construction projects has demonstrated their capacity to severely interrupt sleep patterns" (II:17.6).

• Endangered and Threatened Species of Flora and Fauna

1. The draft report mentions the loss of about 37 acres of existing grassland (I:ES-5) which is described in a later section as a net loss of 39.4 acres of "mowed grass" (I:ES-25), leaving behind 440 acres of vegetation. Of the 39.4 acres lost, 28.5 acres is due to the taxiway improvements, there is a 9% reduction in existing upland vegetation.

2. The loss of vegetation will result in loss of Upland Sandpiper (*Bartramia longicauda*) habitat due to construction of the Centerfield Taxiway between runways 4L/22R and 4R/22L. There is a mitigation plan with the Massachusetts Natural Heritage and Endangered Species Program (MNHES) to save the Upland Sandpiper. Michael Ciaranca, Natural Resource Manager of the Massachusetts National Guard stated that "... you can't simply (physically) move these birds and their nests to a different habitat."[17] Scott Melvin, from MNHES, concurred with Ciaranca that the current bird population and its nests could not be relocated but added that another site at the Massachusetts Military Reservation (Cape Cod) could serve as a new habitat that might conceptually be beneficial for the birds[21].



• Delays

1. The draft report chose 1993, a year in which flights peaked and Logan was overcrowded, as a base year for statistical comparison. In the short term (circa 1999), 29 million passengers were chosen to represent the fleet's annual passenger load. While for the long-term (circa 2010 and beyond), 2 sets were selected: 37.5 and 45 million passengers. At each passenger volume two fleet scenarios were analyzed, representing low and high-range levels of operation (III:Appendix E, p1). The benefits of Alternative Actions 1 and 1A were estimated to provide the greatest level of delay reduction with plan 1 reducing delays by between 29.3% and 60.3% (I:ES-18, and I:4-30). The draft report states that "a comparison of Peak Period Pricing (between 1 and 1A) under near-term, low fleet conditions is only 2 percent" (I:4-30). Table 4.5-2 shows that to be true. But, given the time-line for completing the runway, 1999 is not a realistic goal. Interestingly, the same table shows how the 'no build' option 3 under a high fleet scenario (with either low or high passenger loads) is much better at reducing delays than the 'build' 1A alternative (10% better for a low passenger load and 6.5% better for a high passenger load - see table 4.5-2, I:4-30). The EPA predicts a doubling of passenger capacity by 2010 at Logan (II:EPA Letter 1 dated Nov. 13, 1995), and Massport sees a 35.5% increase by 2010 (29 to 45 million passengers, III:Appendix E, p15), in which case the proposed plan will do little to alleviate congestion. 117.58

2. The Michael S. Dukakis Administration in 1989 imposed a form of peak period pricing which dropped congestion dramatically at the airport[2], thus, putting doubt on the draft report's contention that Peak Pricing is not helpful. 117.59

3. The US Department of Transportation statistics concurs with Massport's data on flight delays. But according to the FAA standards for calculating delays, Logan has only about 3% of its flights delayed[10]. The FAA sensibly does not account for delays of less than 15 minutes or those that end up in flight cancellation. But, even if short delays are excessive, the US Department of Transportation confirmed that delays are not unusual for major airports, even for state-of-the-art facilities like Denver's Centennial airport, which had 29% of its flights delayed last year[11]. 117.60

4. According to FAA data, the delay situation at Logan has improved since 1993 and is essentially in equilibrium. Massport's Aviation Planning Director, Betty Desrosiers, admitted that delays have declined in recent years as airport planners improved scheduling with airlines[10].

CONCLUSIONS

- Massport often hides behind Federal aviation rulings and ignores community pleas to provide relief from daily disturbances living next to the airport (II:9.1). Typically, the draft report gave little to no serious attention to harmful noise and pollution impacts on the people in local communities, including residential neighborhoods, schools, parks, homes for the elderly, monuments, plants, and historic and cultural land. The proposed runway would adversely affect the noise and air quality in surrounding communities and seriously prevent or hamper many redevelopment efforts currently underway. 117.61

- The widespread broadening of flights over many neighborhoods would increase noise impact to intolerable levels. Studies indicate that noise affects one's ability to concentrate and can cause sleep deprivation, resulting in potentially deleterious effects on health and well being[7]. James Maas, professor of psychology at Cornell University and author of "Power Sleep", warned that getting enough sleep is more important than diet, exercise, or any other factor in increasing people's longevity[12]. 117.62

- The draft's conclusions are drawn based on data models that fail to analyze true health impacts or to assess meaningful noise measurements. In fact, the Director of the Environment Department of the City of Boston stated that "... none of the scenarios presented can be considered to provide significant reductions in environmental impacts from airport operations. In particular, the proposed runway 14/32, touted for its unidirectional over-water approach/departure, is only marginally effective at reducing noise" (II:11.1). 117.63

- The EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that *any* increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult (II:1). 117.64

- While implementation of Peak Period Pricing was initially considered, the report claimed that "no US airport imposes a peak pricing system", and that "airline over-scheduling is not a significant contributor to delay under low fleet conditions or in the current or near-term environment at Logan" (I:ES-18). But, interestingly, the same report admits in a footnote that both New York and New Jersey Port Authorities apply a 'surcharge' to general aviation aircraft operating during peak hours. Furthermore, the Dukakis administration in 1989 imposed a form of peak period pricing which dropped congestion dramatically at the airport[2]. Recently, the Conservation Law Foundation weighed in against the runway plan, arguing that Massport could do more to alleviate flight delays by creating cost disincentives for airlines to fly at peak times[24]. 117.65

- The Draft's attempt to 'divide and conquer' local communities by promising a balance in overhead flights is ill advised. In fact, the new runway and taxiway will allow the airport to grow beyond rational limits. Bennet Heart, a spokesperson from the Conservation Law Foundation, stated that "the (environmental impact statement) paints a fairly frightening projection for growth at Logan"[25]. Growth of Logan will augment existing noise and chemical pollution levels for nearby communities. Most troubling is the disproportionate, biased, and significant increase in air traffic over low-income and minority communities of East Boston, Chelsea, Everett, and Roxbury. 117.66

- The report often failed to reference the appropriate tables for the graphs shown. Given the amount of time we were allotted to provide a response, we spend precious time looking for raw data that were not referenced in the shown graphs (see bar graph ES-4: I:ES-19). 117.67

- It is clear from the data that there is no significant decrease in congestion or delays due to the proposed plan and that any minor decrease in delay is invalidated by the immense social cost to the neighboring communities. US Representative Michael Capuano wisely stated that "if 14/32 will not permanently reduce delays, we shouldn't build it. The detrimental impact on our neighborhoods is too great. The burden of proof is on Massport to explain why there is a need for 14/32 when it will drastically increase airplane noise in many communities and doesn't even represent a permanent solution to the problem."[16] Logan has reached its capacity. To obviate the build option, a regional solution should be adopted. It involves moving cargo traffic to regional airports, building a connector from Worcester Airport to MassPike, working to establish North/South rail link and services, and implementing Peak Period Pricing. Long term solutions should look into planning and building a regional airport with an eye on the origin-destination demand (Table 4). 117.68

TABLE 4 - LOGAN'S ORIGIN-DESTINATION DEMAND BY REGION

Region	% of Logan's origin-destination
Vermont	0.4%
Maine	2.8%
New Hampshire	7.4%
Connecticut	0.3%
Rhode Island	2.4%
Massachusetts, west of 495	8.8%
Massachusetts, between Rt. 128 and I-495[2]	**28.6%**
Massachusetts, inside Rt. 128 excluding Boston[2]	**28.6%**
Massachusetts, City of Boston	20.6%
Total	99.9

[1] Adapted from I:2-8 and Executive Summary Report:ES-10.
[2] Combined 57.2% of Logan's origin and destination passenger demand is drawn from these two regions.

- Massport purports the draft report to be a full disclosure document. But, it leaves many details out and obscures the major issues that can potentially affect public health which deserves full public scrutiny under The Massachusetts Environmental Policy Act (MEPA). As the project would significantly increase Logan's airside capacity, the environmental consequences would be extraordinary. Failure to see the environmental impact of the build option will condemn hundreds of thousands of local residents to living with deteriorating medical, social, and environmental conditions. These communities have not been given fair consideration in this matter. 117.69

- Given Massport's history at keeping promises[26], its current assurance[22] that runway 14/32 will be unidirectional is dubious at best (I:ES-4). The FAA and Massport can reverse this 'flight of fancy' promise at any time following runway completion. 117.70

- In the final analysis, Massport is putting a price on our heads. The Agency is gambling away the public's health in favor of alleviating what are mostly minor delays. As the level and cost of airport pollution climbs, Massport has made no apologies and has not addressed the long-term and cumulative impact of pollutants on our health and the environment in a satisfactory manner. 117.71

Massport's argument regarding the "Airside Improvement Project" is myopic: It concentrates more on the economics of cutting airline cost and business benefits but minimizes the tremendous environmental, social, and medical costs it is imposing on its neighbors. The true cost to society, in other words, is never measured properly. We respectfully submit that any permanent and long-term impact damage visited on local communities should not be brushed aside in favor of business 'profit' or for alleviating petty delays. And that any money earmarked for Logan expansion would be better spent on alleviating current levels of noise and chemical pollution felt throughout the local communities.

ACE
alternatives for community & environment
Law and Education for Environmental Justice

On February 11, 1994, President Clinton signed Executive Order 12898, the Executive Order on Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations ("Executive Order on Environmental Justice"). This precedent-setting measure for the first time in history requires all federal agencies to incorporate achieving environmental justice into their missions by identifying and addressing disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations of the nation.

Following the directive of this Executive Order on Environmental Justice, the Department of Transportation ("DOT"), in concert with all other federal agencies, established its own "Department of Justice Order to Address Environmental Justice in Minority Populations and Low-Income Populations." Binding on all DOT administrations, including the Federal Aviation Administration, this Order is a key component of DOT's June 21, 1995 Environmental Justice Strategy (60 Fed. Reg. 33896).

In sum, the Executive Order on Environmental Justice, DOT's Order on Environmental Justice, and DOT's Environmental Justice Strategy require in no uncertain terms that disproportionate impacts on low-income and minority populations be avoided.

> It is the policy of DOT to promote the principles of environmental justice (as embodied in the Executive Order) through the incorporation of those principles in all DOT programs, policies, and activities. This will be done by fully considering environmental justice principles through planning and decision-making processes in the development of programs, policies, and activities, using the principles of the National Environmental Policy Act of 1969 (NEPA), Title VI of the Civil Rights Act of 1964 (Title VI), . . .and other DOT statutes, regulations and guidance that address or affect infrastructure planning and decisionmaking; social, economic, or environmental matters; public health; and public involvement.

DOT Order to Address Environmental Justice in Minority Populations and Low-Income Populations. [OST Docket No. OST-95-141 (50125)].

The Order underscores the importance of Title VI, further stating that, "[u]nder Title VI, each Federal agency is required to ensure that no person, on the ground of race, color, or national origin, is . . . denied the benefits of, or subject to discrimination under any program or activity receiving Federal financial assistance." *Id.*

DOT's position on environmental justice and fundamental fairness could not be clearer.

Historically an Italian-American population, the community most drastically impacted by Logan International Airport, East Boston, has always been a low- to moderate-income community. However, East Boston is emerging ethnically and culturally as minority populations grow. East Boston now can boast of Italian-Americans living side-by-side with Latino and South East Asian immigrants, for example.

But East Boston is not alone in receiving the impact of Runway 14/32 proposal. With stepped up use of Runway 27 as a part of the new scheme, the communities of Chelsea, Roxbury, the South End, and Jamaica Plain, among others, will receive an appreciable increase in overhead air traffic and noise on the Runway 27 path.

These are the same communities that have the highest asthma hospitalization rate in the state (Roxbury), host the most trash transfer stations, the most brownfields sites, the most diesel buses, and other noxious uses than communities anywhere else in the Greater Boston area. It appears to be no coincidence that Massport and the FAA are planning a further assault on the health and well-being of these communities. The Logan expansion is perpetuating the unfair paradigm that has plagued residents in these communities for decades.

Chelsea is a "majority minority" community with the majority of its residents now people of color. Roxbury continues to be largely populated by people of African descent, now with Haitian, Puerto Rican, Dominican, and Cape Verdean populations along with African-Americans. The South End and Jamaica Plain have similar ethnic mixes that include Latino and African-American populations and a variety of income levels including low-income. Each of these communities includes the very populations that Congress sought to protect under Title VI of the Civil Rights Act of 1964. President Clinton amplified that protection under his Executive Order on Environmental Justice, which was again heightened under the DOT Order on Environmental Justice.

The FAA, by the federal Orders, and Massport, by Title VI, are mandated to make extraordinary efforts to avoid impacts to communities of color as well as low-income communities by selecting appropriate alternatives. The FAA and Massport have failed to make even minimal efforts to avoid impacts to these protected communities. The fact that a host of protected communities in and around Boston will be disproportionately impacted by the proposed expansion is glaring and raises the specter of discrimination prohibited by Title VI of the Civil Rights Act of 1964. 117.72

This proposed expansion is squarely against the letter and spirit of civil rights and environmental justice and in violation of the federal Orders and Title VI. Therefore, the proposed expansion must be stopped.

Toxic Chemical Emissions, Releases and Storage Logan Airport Impact Area

Summary of Emissions In Airport Expansion Impact Area

Boston, Somerville, Winthrop and other Logan Airport-impacted communities receive a significant burden of toxic chemicals in their air from local concerns which use hazardous chemicals. Additional chemical compounds which are hazardous to health are contributed by air and ground traffic-related sources. These include nitrogen and sulfur oxides, as well as hydrocarbon-based particulates and ozone-producing compounds. The full listing of specific sources included in the USEPA's records follows in an appendix. These records are available from the Toxic Release Inventory(TRI) and the Aerometric Information Retrieval System (AIRS).

These host communities already experience a dose of hazardous air pollutants (HAPs) which measurably, and perhaps dramatically, harms their health. By concentrating airport bound ground traffic into the expanding Logan facility, residents exposure to HAPs increases. Measures which increase this ground and air traffic, such as the expanded parking facilities and runway expansion, add to the air pollution burden.

The host communities are exposed to hazardous air pollutants from stalled tunnel traffic, cars and trucks servicing Logan, local highways and airport access routes, and the airport and aircraft themselves. Given recent reports based on USEPA data that 60 % of these air toxics are being generated by transportation sources, it seems that consideration must be given to reducing traffic in the airport impact area, rather than increasing it. Reducing flight delays does nothing to reduce these air toxics impacts. A regional approach to reducing the ground and air traffic loads is needed.

Boston residents already experience lung cancer rates 18 % greater than statewide averages, with corresponding increases of 62 % for liver, 60 % for esophageal, and 24 % for stomach cancers. Revere residents have 80 % more than expected levels of non-Hodgkins Lymphoma. Everett lung cancer rates are 33 % higher than expected. Women in Hull have 91 % higher than expected levels of lung cancer. (All data is from MADPH 1987 - 1994 figures for males, except where noted)

Impact of Air Pollutants on Health

Government estimates of toxic chemical concentrations in local air indicate that most Americans – over 220 million people -- live in neighborhoods where the additional cancer risk from toxic chemicals in outdoor air was more than 100 times higher than the goal set by Congress a decade ago. For 11 million Americans, according to the new estimates, cancer risk from their neighborhood air is more than 1,000 times higher than Congress' goal, the Environmental Defense Fund (EDF) announced on April 20, 1999. (Source: Environmental Defense Fund report based on USEPA data. see http://www.edf.org)

The newly released government figures are based on 1990 data and represent the first-ever estimate of which toxic chemicals, in what amounts, are in local communities' air. EDF took the government figures and calculated the associated health risks for each community. The 1990-based government estimates come with official cautions about their use, and several accuracy checks showing close comparability with measurements as recent as 1997.

"The numbers show that cars, trucks, and small businesses tend to be responsible for much more of the air's toxicity than is generally recognized," said EDF attorney David Roe. Of the air cancer risk calculated by EDF for the US as a whole, 60% is from mobile sources and 26% from small-business 'area' sources, with the remaining 14% from industrial 'point' sources. "Up to now, lack of information has meant lack of attention to some of the biggest causes of toxic air," Roe said. (see: http://www.edf.org/pubs/NewsReleases/1999/Apr/d_scorecard.html)

Illustrating the point is the fact that the District of Columbia shows a higher per-capita cancer risk in its air than any of the 50 states, despite having virtually no major industrial facilities. Car and truck traffic and the Ronald Reagan (National) Airport were its main sources of air toxics.

Asthma Incidence

New England has the highest number of hospital visits due to asthma per capita, 81% higher than the national average. (IMS) In fact, 10-20% of all summertime respiratory-related hospital visits in the Northeast are associated with ozone pollution. (EPA)

Asthma is the 6th most prevalent chronic condition among adults and children. In the last 10 years the incidence of asthma has doubled, especially among minority populations living in urban areas. (ALA)

Asthma is the most common chronic disease for children. It is the leading cause of school absenteeism; one third of all missed school days are attributed to asthma. For children, asthma is the number one cause of doctor's office visits, emergency room visits, and hospital admissions(Data source: EPA, NEJM; Text source: MADEP)

Role of Motor Vehicle Traffic In Air Pollution

Traffic on the road causes about 40% of the pollutants that react with sunlight to produce ground-level ozone, the main ingredient in smog. (MADEP) Ozone irritates living tissue in lungs, eyes, nose. It burns your lungs the way the sun burns your skin. (ALA)

There are over 4.2 million cars, and about 100,000 buses and trucks,registered in Massachusetts and driving on our roads. And another 500,000 commercial vehicles pass through our state on any given day. (Source: MA DEP web site: http:// www.dep.state.ma.us.

Summation

Any credible model for pollutant reduction includes efforts such as replacing short haul air traffic and its associated ground automobile traffic with electrified high speed rail. This more efficient transportation system would have a positive effect on air pollution if it were given the same level of support from parts of the Community which have pressed for Logan runway expansion. 117.73

The communities in the Logan Airport impact area already experience higher levels of cancer and asthma specifically because of the excessive burden of transportation emissions they experience. Increasing the pace of these emissions may well add to this burden of exposure.

Code	Topic 1	Topic 2	Comment	Response
117.1	Air Quality	Impacts	It is probable that construction of a new runway will in fact create new opportunities for growth in airport operations, and consequently, in aircraft and motor vehicle emissions. Viewed this way, Massport's assertion that air quality impacts from 14/32 are beneficial or negligible is just downright wrong.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent EDRs (Annual Updates).
117.2	Air Quality	NAAQS	Massport pays scant attention to Logan's role in MA's ozone problem...the DEIS explores the issue superficially, despite its own projection that Logan growth will cause significant increases in NOx emissions in coming years.	40 CFR 93 instructs parties to address ozone by quantifying its precursors, NO_x and VOCs. This quantification was done for the EIS/EIR, comparing project-related NO_x and VOC emissions to the *de minimis* values for this non-attainment area. The project-related emissions were shown to be *de minimis*.
117.3	Air Quality	NAAQS	The DEIS fails to properly consider certain hazardous air pollutants (HAPs) like benzene and formaldehyde that are known or probable carcinogens, through its misleading use of overly-broad categories.	Although hazardous air pollutants (HAPs) are not specifically addressed, Section 6.8.7 of the Supplemental DEIS/FEIR includes a discussion of public health. Because VOCs and PM_{10} emissions are lower with the Airside Project than without it, it can be concluded that from these emissions will also be lower with the Airside Project Alternatives, when compared to the No Action Alternative.
117.4	Air Quality	NAAQS	Massport's own projections show significant increases in emissions of particulates with diameters less than 10 microns...the DEIS fails to adequately treat the special concerns associated with particulates of less than 2.5 microns.	Particulate Matter (PM) emission factors for aircraft are very limited, at best, and nonexistent in most cases. Therefore, as a conservative, worst-case assumption, the air quality analysis assumed that all PM is less than 10 microns in diameter. No emission factors or approximation methods are available for $PM_{2.5}$. The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR and Appendix F. These inventories show that all Alternatives, including the No Action and Preferred Alternative, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.
117.5	Noise	Impacts	...Massport's treatment of noise as largely a nuisance factor to be dealt with only within the confines of narrowly-drawn and ill-defined contours is unacceptable.	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.

Code	Topic 1	Topic 2	Comment	Response
117.6	Air Quality	Model	The DEIS appears to sharply understate these motor vehicle emissions, by assuming—inexplicably—that motor vehicle traffic growth will lag well behind passenger growth; the direct opposite of what has actually proven true in recent years.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
117.7	Air Quality	Model	The DEIS analysis does not include aircraft emissions at altitudes of above 3,000'.	Emissions released above 3,000 feet are not expected to have any ground-level impact. Therefore, a mixing height of 3,000 feet is considered acceptable for this analysis.
117.8	Environmental Justice	Impacts	...Massport's proposal clearly flouts President Clinton's Executive Order No. 12898, making environmental justice a key criterion.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
117.9	Public Health	Effects	...Massport should be required to thoroughly assess potential health effects associated with existing levels of Logan operations on Massachusetts residents.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
117.10	Regional Transportation	Regional Airports	Massport instead must be required to operate within the context of a true long-term transportation plan for our region, one that...makes maximum best use of other airports in our region like T.F. Green and Manchester....	Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Worcester Regional and Manchester airports. Service developments and increased traffic at these airports are a component of the region's long-term strategy to accommodate passengers and activity growth. By its agreement to assume operational responsibility and the eventual ownership of Worcester Regional Airport, Massport is working to increase air services at Worcester Regional Airport and its role in accommodating air travel demand generated in communities west of I-95 and I-495. Greater use of the regional airports will relieve traffic growth pressures at Logan Airport, but will not eliminate the need for the Airside Project. Developments at the regional airports and their impacts on Logan Airport are described in Chapter 2 of the Supplemental DEIS/FEIR.
117.11	Regional Alternatives	Passenger Rail	...[a long-term transportation plan] shifts us away from ever-increasing reliance on air travel, and toward transportation alternatives like high-speed rail that have far lower environmental and human impacts.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
117.12	General Opposition		...demand...A binding and legal agreement which halts any existing plans to expand Logan Airport in any way, shape or form. Including but not limited to the completion of the proposed Runway 14/32 and the centerfield taxiway.	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.
117.13	Regional Transportation	Regional Airports	...demand...a regional transportation plan that addresses New England's long-term transportation needs with less reliance on Logan.	Refer to response to Comment 117.10.

Code	Topic 1	Topic 2	Comment	Response
117.14	Environmental Review Process	Blue Ribbon Panel	...demand...An outside evaluation of Logan Airport which assesses performance and makes recommendations for improvements within the existing infrastructure.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
117.15	Environmental Review Process	Public Process	...demand...Establishment of a citizen's advisory board to serve as a liaison between Massport and the effected communities.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
117.16	Environmental Review Process	Public Process	...demand...Appropriation of funds to conduct an Environmental Impact Study which includes an in-depth, long-term study of Logan Airport's impact on all surrounding cities and towns within heavily traveled flight paths.	To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study.
117.17	Environmental Review Process	Public Process	...demand...Creation of a Good Neighbor Agreement between residents and Massport that requires Massport to provide a forum for good faith negotiations.	Comment noted.
117.18	Air Quality	NAAQS	The EIS fails to address the NOx/ozone question in a meaningful manner, for example, Massport has not included emissions caps in its preferred alternative.	40 CFR 93 instructs parties to address ozone compliance by quantifying its precursors, NO_x and VOCs. This quantification was done for the EIS/EIR. Emissions caps and other potential mitigation measures have been evaluated in the *1999 ESPR*.
117.19	Air Quality	NAAQS	Hazardous Air Pollutants...The EIS fails to assess or project emissions trends for this particularly dangerous component of VOC and fine particulate emissions.	Refer to Response to Comment 117.3.
117.20	Analysis Assumptions/ Methodologies	Passenger Forecasts	...Massport data showing the relationship between passenger use and traffic volume over the past five years suggests that Massport is "low balling" the growth in traffic volume needed to accommodate its forecasts.	The proposed Airside Project will not stimulate additional growth in passenger activity levels at Logan Airport. Off-site motor vehicle emissions estimates are shown in Table 6.4-9 of the Supplemental DEIS/FEIR. Increases in the number of vehicles accessing Logan Airport are not analogous to increases in emissions. As indicated in the table, these emissions generally decrease in the future; as a result of improved motor vehicle emission standards.
117.21	Air Quality	Model	The "emissions gap" problem is heightened by the EIS's neglect of emissions outside of 1-95/128 and aircraft emissions at altitudes greater than 3000 feet.	The air quality analysis was conducted for motor vehicle traffic that can be reasonably distinguished from background traffic on the regional roadway network. Both on-site and off-site roadways are analyzed in Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR. A mixing height of 3,000 feet is standard for aircraft analyses.
117.22	Air Quality	Impacts	...Massport's EIS fails to acknowledge that a new runway will act to stimulate new growth and allow for expansion and is deficient in its assessment of the environmental impacts of Logan expansion.	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Logan Airport Airside analysis and GEIRs.

Code	Topic 1	Topic 2	Comment	Response
117.23	Regional Transportation	Regional Airports	Massport and state authorities should replace the current Logan expansion plan with a regional transportation based on energy-efficient inter-city rail and improvement of the many other New England airports.	Refer to response to Comment 117.10.
117.24	Regional Transportation	Regional Airports	The state should initiate a true stakeholder involvement process to initiate the planning process for a regional transportation plan.	Since 1990, there have been several studies that have recommended regional initiatives to improve the efficiency of the region's inter-city transportation network. These studies reflect the cooperation of federal, state and local transportation agencies and stakeholders. Section 2.1 of the Supplemental DEIS/FEIR summarizes relevant regional planning studies and their conclusions. All studies have concluded that the Proposed Runway 14/32 and the other airside improvement projects at Logan Airport, along with increased use of the regional airports, including T.F. Green/Providence, Manchester and Worcester Regional airports, and high-speed rail services, are all necessary for accommodating the region's future inter-city air travel demand. Refer to discussion of the role of regional alternatives and steps Massport has taken to foster increased use of these alternatives in Chapter 2 of the Supplemental DEIS/FEIR. There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
117.25	Environmental Review Process	MEPA	Massachusetts Department of Environmental Protection should ensure that EIS[EIR] fully address significant environmental problems.	Massport's mitigation measures are reinforced through compliance with M.G.L. Chapter 30A, Section 61 and through specific state and federal certificates approving projects that have mitigation. The status of the Section 61 Finding commitments are tracked and reported in the *Logan Airport 1999 ESPR* (previously GEIR).
117.26	Air Quality	Impacts	...[The EIS] fails to consider the impact that the a new runway will have on growth-related emission trends...Massport cannot back its assertion that "the overall impacts associated with the Airside Project Alternatives are beneficial or will remain imperceptible" from an air quality standpoint.	The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR and Appendix F. These inventories show that all Alternatives, including the No Action and Preferred Alternative, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM10) under any alternative and future year.
117.27	Air Quality	Model	...the analysis does not include aircraft emissions that occur at altitudes greater than 3000 feet...does not include emissions from motor vehicles driving to and from Logan Airport that lie beyond I-95/Route 128...does not...include specific hazardous air pollutants (HAP's) and PM2.5...	A mixing height of 3,000 feet is standard for aircraft analysis. The air quality analysis was conducted for motor vehicle traffic that can be reasonably distinguished from background traffic on the regional roadway network. Both on-site and off-site roadways are analyzed in Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR. Although HAPs are not specifically addressed, Section 6.8.7 of the Supplemental DEIS/FEIR includes a discussion of public health. Particulate Matter (PM) emission factors for aircraft are very limited, at best, and nonexistent in most cases. Therefore, as a conservative, worst-case assumption, the air quality analysis assumed that all PM is less than 10 microns in diameter. No emission factors or approximation methods are available for $PM_{2.5}$.
117.28	Air Quality	NAAQS	One of the most glaring deficiencies of the EIS is its failure to address the potential impact of emission trends...[it] says almost nothing about the impact of Logan emissions on ozone...makes no estimates of the impact of precursor emissions on ozone...fails to assess how the increases in NOx projected for Logan Airport will affect the state's ability to meet the new and stricter 8-hour average standard of 0.08 ppm.	Ozone analyses are conducted on a regional level and are not feasible for a single project. NO_x and VOCs, which are addressed in the Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR, are lower with the project alternatives, when compared to the No Action Alternative.
117.29	Air Quality	NAAQS	...the EIS fails to address a number a critical issues associated with NOx. These are...NOx is an important precursor to acid rain...NOx emissions to the atmosphere are an important source of nitrate deposition to coastal waters...NOx emissions may also form secondary particulate matter, which can impact the respiratory system....	The assessment of NO_x included in the Supplemental DEIS/FEIR shows a reduction in emissions from the Airside Project alternatives, when compared to the No Action Alternative.
117.30	Air Quality	Impacts	The EIS fails to present evidence on the particle size distribution of particles emitted from aircraft...[It] should also consider how this particle size distribution is modified as it moves through the urban atmosphere.	The FAA acknowledges that little or no information is known about the particle size distribution from aircraft emissions. For the purpose of this analysis, it was conservatively assumed that all particulate matter is less than ten microns in diameter.
117.31	Air Quality	Impacts	The Logan EIS presents no information on hazardous air pollutants and their potential impact on cancer rates in surrounding communities.	Refer to Response to Comment 117.3.
117.32	Ground Transportation	Access to Logan	The EIS does not sufficiently address the impact of its projected expansion rates on airport traffic.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
117.33	Regional Transportation	Regional Airports	The EIS fails to develop a regional transportation plan as a serious alternative to a new runway and continued expansion.	Refer to response to Comment 117.10.

Code	Topic 1	Topic 2	Comment	Response
117.34	Open Space/ Parkland	Impacts	Runway 14/32 will triple the overflights and ruin the Arboretum for all our citizens.	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands.
117.35	General Opposition		More runways mean more plane traffic which means more pollution and greater environmental damage.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.
117.36	Alternatives	Preferred Alternative	Why is it that I have to pay for an HOV lane on the Southeast Expressway that I can't use, but Massport says it can't limit puddle jumpers' access to Logan? Why not an "HOV airport?"	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.
117.37	General Opposition		Why does Massport calculate the value of passengers' time lost to delays, but ignore the economic costs Logan imposes every day on its neighbors?	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
117.38	Noise	Sound Insulation	Massport sent us...a letter telling us that we did not qualify for sound proofing. Massport says our home lies four houses away from the noise contour lines which Massport presently utilizes.	Massport continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR.*
117.39	Air Quality	NAAQS	Because of Logan, East Boston's air quality violates the Federal Clean Air Act....	The dispersion modeling results indicate no violation of the NAAQS (NAAQS) or, analogously, the CAA because of Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
117.40	Regional Transportation	Regional Airports	Regional planning-not runway expansion-should be implemented immediately.	Regional initiatives to improve the efficiency of the region's inter-city transportation network have been studied since 1989. Section 2.1 of the Supplemental DEIS/FEIR summarizes relevant planning studies and their major conclusions. A regional transportation strategy that includes the expansion of regional airports, the development of high-speed rail, and the construction of Runway 14/32 and other infrastructure improvements at Logan Airport has evolved from these important studies. All the major improvements to the regional transportation system have been implemented except for improvements to Logan Airport's airfield. The regional airports have been experiencing tremendous growth in services and passenger traffic since 1996 and Amtrak introduced its high-speed Acela train service between Boston and New York in December 2000. Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. While greater use of the regional airports and high-speed rail will provide relief to Logan Airport, the proposed Airside Project provides clear benefits at current, as well as future, traffic levels. The benefits will only increase in the future, even as regional transportation developments act to reduce the rate of future growth at Logan Airport.
117.41	Noise	Impacts	What is Massport's plan to help abutters live with the present noise and contamination?	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. Chapter 8 of the Supplemental DEIS/FEIR summarizes Massport's proposed project-specific mitigation program associated with the Preferred Alternative including: Runway 14/32 would be designed, constructed, and operated to handle over-water operations only. Massport would seek to construct Runway 14/32 to reflect unidirectional use. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. During the construction period an extensive array of traffic, air quality and noise mitigation measures will be employed to mitigate temporary construction impacts. A PRAS monitoring system to gather data and report on the actual achievement of PRAS. The objective of this system is to improve the FAA's achievement of the community's PRAS goals and to provide a broader platform for disclosure of the monitoring results. While not related to Airside Project impacts, Massport will commit to discussions with the FAA with the goal of instituting local or national restrictions on the use of hushkitted Stage 3 aircraft at Logan Airport. Massport reports the status of those consultations in the *1999 ESPR* and subsequent EDR. Massport is actively involved in many air quality initiatives and explored other options to reduce emissions from activities at Logan Airport in the *1999 ESPR*

Code	Topic 1	Topic 2	Comment	Response
117.42	Air Quality	Impacts	I'm also concerned about the air pollution from the planes overhead. Is anyone thinking about the effects of that?	Aircraft emissions are evaluated to 3,000 feet. Beyond this height, emitted gases and particles are not expected to have substantial ground-level effects.
117.43	General Opposition		Sixty thousand jets over the South End are going to cause air pollution and if they want to fly any lower, there'll be no quality of life.	Emissions are shown to decrease with the Preferred Alternative when compared to the No Action Alternative. Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
117.44	Air Quality	Impacts	Eight years ago when I moved into my house in Winthrop, I could hear the airport, but now with the increase in air travel I can also smell the jet fuel, and tires burning from the landings.	The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative. Massport is actively involved in many air quality initiatives and explored other options to reduce emissions from activities at Logan Airport in the *Logan Airport 1999 ESPR* (previously GEIR).
117.45	General Opposition		...a family who grew up in the same house near the airport, at least three of us have gotten asthma.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop.A review of the available information did not indicate any causal relationship based on proximity to the airport. The 1999 Massachusetts budget included $150,000 to fund an environmental assessment of the health impacts of Logan Airport on any community located within a five-mile radius of the airport. The final protocol for the study is being developed. The study is expected to be completed in summer 2002.
117.46	Noise	Impacts	The FAA's threshold of 65 decibels does not accurately assess how many people are disturbed by aircraft noise.	A noise exposure of 55 to 65 dB DNL is believed to be generally compatible with residential land use, although the expected percentage of the population to be highly annoyed ranges from four percent at the 55 dB end of the range to 15 percent at the 65 dB end. Exposure to 65 to 75 dB DNL is considered marginally compatible with residential land use with residential structures that have a 25 to 30 dB noise level reduction. In this higher noise exposure range, the expected percentage of the population to be highly annoyed varies from 15 percent at 65 dB to 37 percent at 75 dB.
117.47	Noise	Mitigation	No remedy was given [in the Draft EIS/EIR] for the structural damage due to low-flying aircraft vibrating homes, school buildings, monuments, and industrial infrastructures within the affected communities.	Neither Massport nor the FAA is aware of any evidence to support the contention that structural damage has ever occurred due to overflights. Noise-induced vibration levels from aircraft, though they may cause rattling, are normally less than footfalls produced by people walking through their own homes.

Code	Topic 1	Topic 2	Comment	Response
117.48	Environmental Justice	Impacts	...if the plan is implemented, there will be a disproportionate and exorbitant increase in flights over poorer communities such as sections of Chelsea, East Boston, Everett, and Roxbury.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.
117.49	Open Space/ Parkland	Impacts	The Harbor Islands recreational area will suffer significant noise impact.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
117.50	Analysis Assumptions/ Methodologies	Base Year	...emission predictor uses 1993 as a contrast item...the predicted emission reductions for year 2010 are undoubtedly minimized to favor a lesser environmental impact.	The Supplemental DEIS/FEIR includes updated operational and environmental analyses of 1998 conditions similar to that contained in the *1998 Annual Update* prepared in October 1999. While the *1999 ESPR* published in December 2000 includes updated analyses for 1999, the differences between the two study years are small. Between 1998 and 1999, operations declined by 2.5 percent, primarily due to a decline in regional carrier operations. Since the fleet mix and runway use varied little, the shape of the noise contours and the population impacts were also similar, with slightly less impact in Winthrop and Boston and slightly more impact in Chelsea and Revere in 1999 compared to 1998. The air quality and other environmental analyses also yielded similar results. Since the relevant comparison for evaluating the proposed airside improvements is the comparison between the No Action and Preferred Alternatives, and since 1998 and 1999 are similar in terms of passengers, operations, and environmental impacts, this Supplemental DEIS/FEIR maintains the 1998 modeling analysis as a representation of recent conditions at Logan Airport.
117.51	Air Quality	Model	...the proposed action model predictor uses alternative 1 to attain this analytical profile...Since plan 1 was rejected in favor of plan 1A, these data do not necessarily fit the report's final conclusions....	The air quality assessment was conducted for the No Action Alternative (Alternative 4) and Alternative 1 (the Preferred Alternative with PPP) because the full range of potential air quality effects is bracketed by Alternatives 1 and 4. Alternative 1 results in the same air quality conditions as the Preferred Alternative (Alternative 1A).
117.52	Air Quality	Impacts	The additional combustion of gasoline and oil will increase the total Volatile Organic Compounds or Hydrocarbons (VOCs) in the atmosphere.	Although VOC emissions increase over time because of increased aircraft operations activity at Logan Airport, emissions are lower with Alternatives 1 and the Preferred Alternative, when compared to the No Action Alternative. The decreases are attributable to both the proposed Runway 14/32 and the taxiway improvements.
117.53	Air Quality	Impacts	The projected increase in passenger volume to 45 million by 2010 will have an adverse effect on the local transportation and air quality by increasing the overall level of ozone in the airport region and on roads leading to the airport.	Although ozone dispersion modeling is not possible for the Airside Project (because ozone, which is not directly emitted but formed through reactions, modeling must be done on a regional basis), emissions and dispersion of ozone precursors were calculated. The NO_x and VOC emissions from the Airside Project have been compared to the federally set *de minimis* levels for an ozone non-attainment area. Project-related emissions, which include local transportation emissions, have been found to be *de minimis*.

Code	Topic 1	Topic 2	Comment	Response
117.54	Air Quality	Impacts	Local airport traffic will also add to the problem of Carbon Monoxide (CO) emission.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.
117.55	Air Quality	NAAQS	Benzene, dioxin, toluene, xylene, and formaldehyde are known to be toxic and carcinogenic even at minute concentrations. None were monitored individually in the draft EIS/EIR study.	Toxic or hazardous air pollutants are discussed in Section 6.4 of the Supplemental DEIS/FEIR.
117.56	Air Quality	Impacts	Lead emissions were not assessed by the draft report...the lack of sufficient epidemiological and long-term health impact analysis due to these pollutants on people in affected communities is troubling.	Lead, in general, is not associated with airport emissions. The phasing out of leaded gasoline in motor vehicles means that this compound is no longer a problem in most of the United States. Issues related to health are discussed in Section 6.8 of the Supplemental DEIS/FEIR.
117.57	Ground Transportation	Impacts	The expected increase in traffic load will go on for years and will add to the already overly congested roads that lead to and from the airport.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
117.58	Analysis Assumptions/ Methodologies	Base Year	The draft report chose 1993, a year in which flights peaked and Logan was overcrowded, as a base year for statistical comparison.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
117.59	Alternatives	Peak Period Pricing	The Michael S. Dukakis Administration in 1989 imposed a form of peak period pricing which dropped congestion dramatically at the airport, thus, putting doubt on the draft report's contention that Peak Pricing is not helpful.	The impacts of the Program for Airfield Capacity Efficiency (PACE) are described and evaluated in Section 3.5.1 of the Supplemental DEIS/FEIR.
117.60	Purpose and Need	Delay	...even if short delays are excessive, the US Department of Transportation confirmed that delays are not unusual for major airports, even for state-of-the-art facilities like Denver's Centennial airport, which had 29% of its flights delayed last year. According to FAA data, the delay situation at Logan has improved since 1993 and is essentially in equilibrium.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion by addressing constraints at Logan Airport. Delays caused by conditions at other airports or other factors, such as mechanical failure, are not addressed since Massport cannot influence these delays. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays which would be directly affected by Runway 14/32 have risen steadily since 1994.

Code	Topic 1	Topic 2	Comment	Response
117.61	Noise, Air Quality	Impacts	The proposed runway would adversely affect the noise and air quality in surrounding communities and seriously prevent or hamper many redevelopment efforts currently underway.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
117.62	Noise	Impacts	The widespread broadening of flights over many neighborhoods would increase noise impact to intolerable levels.	There is no change in the flight paths over most of the neighborhoods. The only changes in flight paths are associated with new Runway 14/32 and these changes occur primarily over water, not over neighborhoods.
117.63	Noise	Impacts	The draft's conclusions are drawn based on data models that fail to analyze true health impacts or to assess meaningful noise measurements.	The models used for the air quality analyses (emissions inventory and dispersion modeling) are EPA- , DEP-, and FAA-approved. The dispersion modeling allows impacts to be compared to the NAAQS (NAAQS), which are designed to protect human health and welfare, including sensitive groups. There were no violations of the NAAQS for any alternative. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights.
117.64	Air Quality	NAAQS	The EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that any increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult....	DEP recently submitted a demonstration of an ozone (one-hour average) attainment plan to the U.S. EPA. This plan includes current Logan Airport-related emissions and all other emissions in Massachusetts. It is expected that DEP will be able to continue to include airport-related emissions, which show Massport's emission reduction measures, in the ozone attainment plan.

Code	Topic 1	Topic 2	Comment	Response
117.65	Alternatives	Peak Period Pricing	Peak Period Pricing [should be] considered.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. See Section 4.5.4 of the Supplemental DEIS/FEIR.
117.66	Environmental Justice	Impacts	Most troubling is the disproportionate, biased, and significant increase in air traffic over low-income and minority communities of East Boston, Chelsea, Everett, and Roxbury.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
117.67	Noise	Studies	The report often failed to reference the appropriate tables for the graphs shown.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
117.68	Regional Transportation	Regional Airports	To obviate the build option, a regional solution should be adopted.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
117.69	Public Health	Effects	Failure to see the environmental impact of the build option will condemn hundreds of thousand of local residents to living with deteriorating medical, social, and environmental conditions.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport. The 1999 Massachusetts budget included $150,000 to fund an environmental assessment of the health impacts of Logan Airport on any community located within a five-mile radius of the airport. The final protocol for the study is being developed. The study is expected to be completed in summer 2002. Emissions are shown to decrease with the Preferred Alternative when compared to the No Action Alternative.
117.70	Alternatives	Runway 14/32	Given Massport's history at keeping promises, it current assurance that runway 14/32 will be unidirectional is dubious at best....	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
117.71	Public Health	Effects	...Massport...has not addressed the long-term and cumulative impact of pollutants on our health and the environment in a satisfactory manner.	Refer to response to Comment 117.9.
117.72	Environmental Justice	Impacts	The FAA and Massport have failed to make even minimal efforts to avoid impacts to these protected communities.	Refer to response to Comment 117.66.

Code	Topic 1	Topic 2	Comment	Response
117.73	Regional Transportation	Regional Airports	A regional approach to reducing the ground and air traffic loads is needed...Any credible model for pollutant reduction includes efforts such as replacing short haul air traffic and its associated ground automobile traffic with electrified high speed rail.	Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.

LETTER 118

Hampshire House restaurant calls for action on Logan Airport unidirectional runway 14/32

- The proposed Logan Airport runway 14/32 is critical to the health of Boston's future convention and business travel - and restaurants that depend on the visitor industry -and I urge state and federal officials to move forward on approval of this project. 118.1

- **If we do not act on this now we will be making a multi-*billion* dollar mistake on Boston's future**

- Our competitive position as a leading visitor destination is *directly* tied to the ability of Logan Airport to handle the region's air service needs. The new 14/32 runway will be critical in reducing delays and making Logan Airport more efficient

- **The success of the new $700 million convention center, that will open in the Seaport District in late 2003, depends on the efficiency of Logan Airport.**

- If the delay problem is not addressed, it will cripple our efforts to attract and retain conventions, meetings and business travelers to Boston. At the very time when the new convention center will open delays at Logan International Airport will have grown to the point that will be unacceptable to meeting planners. As the new center reaches peak efficiency - attracting more than 300,000 visitors a year - Logan will become a national disgrace- with delays up to 54 minutes per flight!

- I support the development of a comprehensive regional airport system and the growth of Providence, Manchester and Portland Airports--as well as the high-speed rail system from New York to Boston that debuts later this year. 118.2 118.3

- Nevertheless- Logan remains the hub of the region's transportation system for business travelers and for the convention and meetings market and the success-or failure of the industry and restaurants like Hampshire House depend on an efficient Logan Airport.

Letter 118

Mr. Arthur Pugsley - EOEA No. 10458
M E P A Office
100 Cambridge Street, 20th Floor
Boston, MA 02205

Attention: Secretary of Environmental Affairs

Dear Mr. Pugsley:

The International Union of Operating Engineers, Local 4, is writing today in support of the Massachusetts Port Authority's Airside Improvement plan for Logan International Airport. Local 4 firmly believes this project is necessary to reduce delays, improve the quality of life of our memgbers and provide much needed employment opportunities. 119.1

Delays at Logan are consistently among the worst in the United States. These delays are not only inconvenient, they are costly. In 1998 delays at Logan cost airlines and their passengers nearly $310 million. These losses ultimately affect the livelihood of many working men and women as it impedes the ability of Boston and the region to compete in a global economy.

A major component of the Airside Improvement Project, Runway 14/32, provides significant noise relief our members living in the highest impacted noise areas of East Boston's Bayswater, Revere's Beachmont and Winthrop's Court Road and Point Shirley as well as South Boston's Castle Island area. The new unidirectional Runway shifts 75,000 flights over water rather than over communities. It also allows noise impacts to be spread more equitably across communities. The proposed centerfield taxiway and other improvements would further enhance air quality by reducing aircraft idling and queuing on the airfield and reduce ground noise from taxing aircraft to adjacent neighborhoods. 119.2

With an annual economic impact of $5 billion, Logan International Airport is directly responsible for creating more than 15,000 jobs in this area, many of which are the hard working men and women of the International Union of Operating Engineers.

It is therefore, without reservation, that Local 4 wholeheartedly supports Airside Improvements at Logan Airport and eagerly looks forward to the projects approval.

Thank you for your attention to this matter

Sincerely yours,

William P. Ryan,
Business Manager

LETTER 120

April 22, 1999

Mr. John C. Silva
Manager, Environmenta Programs
Airports Division
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Silva:

I am writing today on behalf of the International Association of Bridge, Structural, Ornamental and Reinforced Iron Workers to voice our strong support for the Massachusetts Port Authority's Airside Improvement plan for Logan International Airport. The Iron Workers District Council firmly believe this project is necessary to reduce delays, improve the quality of life of our members and provide much needed employment opportunities. 120.1

I personally have had many problems getting into Logan. In my last six (6) flights into Logan Airport, my plane was put into a holding pattern just flying around waiting for a runway to open. On a trip from Denver, we were in a holding pattern so long that we started to run out of fuel and had to go to Rhode Island to refuel.

This is not the way a big City like Boston can encourage people to visit our fair city if they are continuously held up by delays, etc.

Logan Airport is constantly building and expanding. Those who have built hotels, etc., depend on the growth of this airport. They can neither grow or expand if traffic is re-routed to another airport.

Mayor Menino worked hard trying to get the National Democratic Convention. If he was successful, how would we have handled the many people coming from all over the Country. Would we send them to Manchester, N.H. or Providence, R.I. and tell them to drive from there?

I know that many of the residents in the town surrounding the airport are concerned and are opposed to a third runway. However, people in those towns still buy homes and open businesses knowing fully well that the airport is there.

The new unidirectional Runway shifts 75,000 flights over water rather than over communities. It also allows noise impacts to be spread more equitably across communities, in accordance with community noise goals. The proposed centerfield taxiway and other taxiway improvements would further enhance air quality by reducing aircraft idling and queuing on the airfield and reduce ground noise from taxing aircraft too close in neighborhoods. 120.2 120.3

Logan International Airport is directly responsible for creating more than 15,000 jobs in this area, many of which are the hard working men and women of the Iron Workers Union.

It is therefore, without reservation, that the Iron Workers District Council wholeheartedly support's Airside Improvements at Logan Airport and eagerly looks forward to the projects approval.

With best wishes, I remain

Sincerely,

Joseph M. Quilty
President

LETTER 121

April 21, 1999

'Executive Office of Environmental Affairs
ATTENTION MEPA OFFICE
Mr. Arthur Pugsley #10458
100 Cambridge Street, Room 2000
Boston, MA 02202

Dear Mr. Pugsley:

On Monday, February 8, 1999, the Jeffries Point Neighborhood had its monthly meeting. Peter Blute, Executive Director of Massport and his staff were present at this meeting. They gave a presentation on the proposed New Runway and Taxiway 14/32. After the presentation an open dialogue took place between Mr. Blute, his staff, and the participants.

A motion was made to oppose the construction of the New Runway and Taxiway 14/32 a vote was taken, (there was 150 people present) the vote was unanimous.

The Jeffries Point Neighborhood Association has united with other neighborhoods and other communities in strong opposition to the **new runway/taxiway proposal** being made by Massport. Representatives from the JPNA and citizens have been actively meeting with our state and federal government legislators to discuss our concerns regarding this specific proposal, as well as the core problem of dealing with the projections for significant increases in air traffic demand for the region.

Massport has pitched the Runway 14/32 proposal as providing some relief to some areas of East Boston and distributing the impact all over East Boston Winthrop at the expense of Boston and other communities. Even if true, and we have serious doubts, it would only be short-term relief. We are concerned about the entire Boston area as well as the surrounding communities. Regardless of a new runway, and according to Massport's own projections, demand for passengers and aircraft to come to the area is expected to grow significantly, and flight delays are expected to soar. As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in **extreme danger!**

Please know that we support economic growth for Boston, the Commonwealth and New England. We are working closely Mayor Thomas Menino, City Councilors P. Scapacchio, P Mullen, F. Roche, S. Murphy, Senator Travaglini, Congressman Markey, Congressman Capuano and others in support of potential solutions to the regional air transportation problem, such as secondary airports, etc. There are answers to the problem, which could bring economic benefit outside of Boston, but trying to increase capacity at Logan is not the answer. Such a course would be severely detrimental to those of us who call the Boston area home and, ironically, to those visitors expected to fly here as well. Our health and safety are already at great risk. Our burden has increased each year. We cannot accept more!

Listed below are the some of reasons we think that Massport's draft environmental impact study (EIS/EIR0 is flawed:

- Massport's draft environmental impact study (EIS/EIR) did not rigorously explore all reasonable alternatives. 121.1
- Massport supported its conclusions with outdated studies and figures.
- There can be not guarantee of "unidirectional use" of Runway 14/32. This is an FAA decision and the FAA is making no such guarantee 121.2
- FAA modeling was not used. FAA data shows delay reduction since 1993. Massport's delay figures are inflated. 121.3
- **Affected communities were not given fair consideration we will bet 23,000 more flights over our heads annually. Soundproofing cannot mitigate the impact of this increase in noise and air pollution.** 121.4
- 121.5

Huge issues such as air pollution and respiratory health, unequal impacts, secondary ground traffic and others are ignored or glossed over, enough so that in truth, on might well ask if there is anything good to be said about it. Y 121.6

Sir, we need your attention to this issue. We ask that you listen to our concerns and protect the **Quality of Life in our Community**, hear our concerns regarding our health and the environmental impact of this proposal. There are serious questions regarding the adequacy, quality and reliability of information supplied by Massport. Additional

understand that the quality of life of Boston area residents is threatened. We need your help!

Respectfully,

Karen M. Maddalena
Chairperson

Code	Topic 1	Topic 2	Comment	Response
121.1	General Opposition		A motion was made to oppose the construction of the New Runway and Taxiway 14/32 a vote was taken, (there was 150 people present) the vote was unanimous.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.
121.2	Environmental Review process	MEPA	Massport's draft environmental impact study (EIS/EIR) did not rigorously explore all reasonable alternatives.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
121.3	Analysis Assumptions/ Methodologies	Base Year	Massport supported its conclusions with outdated studies and figures.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
121.4	Alternatives	Runway 14/32	There can be no guarantee of "unidirectional use" of Runway 14/32. This is an FAA decision and the FAA is making no such guarantee.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
121.5	Delay	Model	FAA modeling was not used. FAA data shows delay reduction since 1993. Massport's delay figures are inflated.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

Code	Topic 1	Topic 2	Comment	Response
121.6	Noise	Sound Insulation	Soundproofing cannot mitigate the impact of this increase in noise and air pollution.	While sound insulation does not mitigate exterior sound levels, it is a widely accepted measure considered appropriate for general mitigation of noise impacts. Sound insulation reduces noise inside the home. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative. The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR and Appendix F. These inventories show that all Alternatives, including the No Action and Preferred Alternative, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.
121.7	Public Health	Effects	Huge issues such as air pollution and respiratory health, unequal impacts, secondary ground traffic and others are ignored or glossed over, enough so that in truth, one might well ask if there is anything good to be said about it.	Noise was identified as the only off-airport impact from the Preferred Alternative (refer to Section 6.2 of the Supplemental DEIS/FEIR for a discussion on noise impacts). Because of improved airfield efficiency and shorter delay periods, the Preferred Alternative is projected to slightly reduce air emissions when compared to the No Action Alternative. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8.7 of the Supplemental DEIS/FEIR. A review of the available information did not indicate any causal relationship based on proximity to the airport. Construction will be managed to minimize air, noise and other impacts to the adjacent communities. All construction vehicles will be required to use designated truck routes and avoid local streets.

LETTER 122

Jeffries Point Neighborhood Association
C/o Ms. Karen M. Maddalena
4 Lamson Street
East Boston, MA 02128

April 21, 1999

Executive Office of Environmental Affairs
ATTENTION MEPA OFFICE
Mr. Arthur Pugsley #10458
100 Cambridge Street, Room 2000
Boston, MA 02202

Dear Mr. Pugsley:

Enclosed in this package are petitions and letters from the Jeffries Point community and impacted communities. The people who signed these petitions and letters are concerned about the expansion of Logan Airport and the environmental issues caused by this expansion..

Listed below are the some of reasons we think that Massport's draft environmental impact study (EIS/EIR0 is flawed:

- Massport's draft environmental impact study (EIS/EIR) did not rigorously explore all reasonable alternatives. 122.1
- Massport supported its conclusions with outdated studies and figures. 122.2
- There can be not guarantee of "unidirectional use" of Runway 14/32. This is an FAA decision and the FAA is making no such guarantee 122.3
- FAA modeling was not used. FAA data shows delay reduction since 1993. Massport's delay figures are inflated. 122.4
- **Affected communities were not given fair consideration we will bet 23,000 more flights over our heads annually. Soundproofing cannot mitigate the impact of this increase in noise and air pollution.** 122.5
-

Huge issues such as air pollution and respiratory health, unequal impacts, secondary ground traffic and others are ignored or glossed over, enough so that in truth, on might well ask if there is anything good to be said about it. 122.6

Sir, we need your attention to this issue. We ask that you listen to our concerns and protect the **Quality of Life in our Community**, hear our concerns regarding our health and the environmental impact of this proposal. There are serious questions regarding the adequacy, quality and reliability of information supplied by Massport. Additional health/environmental studies are needed to access the damage already caused by Logan Airport. We ask you to understand that the quality of life of Boston area residents is threatened. We need your help!

Respectfully,

Karen M. Maddalena
Chairperson

Jeffries Point Neighborhood Association and Impacted Communities

SUPPORT: REGIONAL TRANSPORTATION PLANNING
rail development
use of alternate regional airports
NO LOGAN INTERNATIONAL AIRPORT EXPANSION!

Massport is pushing for major expansion at Logan International Airport which will eventually lead to increased flights, noise and pollution over, and in, our neighborhoods and surrounding communities. The new projects will further **erode our quality of life.** It will also be inadequate to handle the increased demand soon after it is built. We, the undersigned, demand that Massport and do the necessary regional transportation planning fully, including high-speed and other rail development for the Greater Boston area before enbarking on any expansion project. If Logan Airport is an "economic engine" for New England, then let the rest of New England share in its impact.

Neighborhood Association and Impacted Communities

We the undersigned are opposed to " Logan Airside Improvement Plan" (the proposed construction of Runway 14/32, the Centerfield Taxiway at Logan Airport, and the lowering of the minimum.) There are far too many unanswered question to allow the runways to be built. The proposed runways will affect our Quality of Life. The people who currently reside in the impacted communities currently experience traffic congestion, noise, and a polluted environment from the planes, automobiles, trucks, busses and other Massport related operations.

Jeffries Point Neighborhood Association and Impacted Communities

We the undersigned are opposed to " Logan Airside Improvement Plan" (the proposed construction of Runway 14/32, the Centerfield Taxiway at Logan Airport, and the lowering of the minimum.) There are far too many unanswered question to allow the runways to be built. The proposed runways will affect our Quality of Life. The people who currently reside in the impacted communities currently experience traffic congestion, noise, and a polluted environment from the planes, automobiles, trucks, busses and other Massport related operations.

Code	Topic 1	Topic 2	Comment	Response
122.1	Environmental Review Process	MEPA	Massport's draft environmental impact study (EIS/EIR) did not rigorously explore all reasonable alternatives.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
122.2	Analysis Assumptions/ Methodologies	Base Year	Massport supported its conclusions with outdated studies and figures.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
122.3	Alternatives	Runway 14/32	There can be no guarantee of "unidirectional use" of Runway 14/32. This is an FAA decision and the FAA is making no such guarantee.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
122.4	Delay	Model	FAA modeling was not used. FAA data shows delay reduction since 1993. Massport's delay figures are inflated.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

Code	Topic 1	Topic 2	Comment	Response
122.5	Noise	Sound Insulation	Soundproofing cannot mitigate the impact of this increase in noise and air pollution.	While sound insulation does not mitigate exterior sound levels, it is a widely accepted measure considered appropriate for general mitigation of noise impacts. Sound insulation reduces noise inside the home. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative. The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR and Appendix F. These inventories show that all Alternatives, including the No Action and Preferred Alternative, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.
122.6	Public Health	Effects	Huge issues such as air pollution and respiratory health, unequal impacts, secondary ground traffic and others are ignored or glossed over, enough so that in truth, one might well ask if there is anything good to be said about it.	Noise was identified as the only off-airport impact from the Preferred Alternative (see Section 6.2 of the Supplemental Draft EIS/Final EIR for a discussion on noise impacts). Because of improved airfield efficiency and shorter delay periods, the Preferred Alternative is projected to slightly reduce air emissions when compared to the No Action Alternative. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental Draft EIS/Final EIR. A review of the available information did not indicate any causal relationship based on proximity to the airport. Construction will be managed to minimize air, noise and other impacts to the adjacent communities. All construction vehicles will be required to use designated truck routes and avoid local streets.

Re: Comments to Draft Environmental Impact Statement
and Draft Environmental Impact Report ("Draft EIS/EIR")
Logan Airside Improvements Planning Project (February 1999)

Dear Messrs. Pugsley and Silva:

These comments are submitted on behalf of our client, LaSalle Hotel Operating Partnership, L.P. ("LaSalle"). Pursuant to LaSalle's Ground Lease with Massport, LaSalle owns the Hyatt Harborside Hotel located at 101 Harborside Drive at Logan International Airport. As the owner of the Hyatt Harborside Hotel, which in addition to providing conference center services, provides accommodations for visitors, tourists and business travelers alike, LaSalle is interested in the proposals set forth in the Draft EIS/EIR that would enhance travel and tourism in Boston and the greater New England region. LaSalle believes that first-class hotel accommodations and conference center facilities play a vital role in attracting and accommodating visitors to the Boston area and have wide-ranging positive economic affects on the region. On behalf of LaSalle's guests, including those from the surrounding communities, we appreciate this opportunity to pose some concerns and questions regarding certain aspects of the Draft EIS/EIR.

LaSalle wishes to voice its opposition to Layout Option A, which according to the Draft EIS/EIR places Runway 14/32 in such close proximity to the Hyatt Harborside Hotel as to raise significant safety, noise and operational concerns that cannot be mitigated. Moreover, Layout Option A would remove 174 parking spaces (or 71% of available parking) from the Hyatt Harborside Hotel, significantly hampering LaSalle's ability to attract guests and operate the Hotel. Such a layout would effectively eliminate LaSalle's ability to attract guests for the conference facilities and operate guest accommodations. As stated in the Draft EIS/EIR, no viable option for parking for the Hyatt Harborside Hotel would be available if Layout Option A moved forward. Layout Option A would, in effect, destroy LaSalle's multi-million dollar investment at Logan. 123.1

In general, LaSalle supports Massport's goal of improving service at Logan through means other than Layout Option A. It would, however, be helpful to have the proponent address certain issues more specifically or direct us to the existing studies that address these issues. In particular, the issues are as follows: (i) the noise impact on the Hotel; (ii) the light impact on the Hotel; (iii) the impact on air quality surrounding the Hotel; (iv) any mitigating steps that might be available to lessen the noise, light, or air quality impacts on the Hotel and who is responsible for the costs of such actions; (v) the area to which airplane parking positions would be relocated; (vi) safety factors for the Hotel's premises and mitigating actions that may be necessary; and (vii) access to and from the Hotel and any possible relocation of Harborside Drive. 123.2 123.3

LaSalle would appreciate the opportunity to review the above matters with Massport prior to Massport filing its Final EIR/EIS so that we can understand the impacts of Massport's proposal and are satisfied that Massport is committed to providing adequate mitigation measures.

Respectfully submitted,

Michael J. Haroz
as attorney for and on behalf of LaSalle Hotel Operating Partnership, L.P.

123.1	Alternatives	Runway 14/32	LaSalle wishes to voice its opposition to Layout Option A, ...Layout Option A would remove 174 parking spaces... significantly hampering LaSalle's ability to attract guests... no viable option for parking for the Hyatt Harborside Hotel would be available if Layout Option A moved forward.	Refer to Section 8.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32.
123.2	Alternatives	Runway 14/32	In general, LaSalle supports Massport's goal of improving service at Logan through means other than Layout Option A.	Refer to response to Comment 123.1.
123.3	Alternatives	Runway 14/32	Issues affecting the Hyatt Harborside Hotel such as noise, light, air quality, mitigation, airplane parking positions, safety factors, and access to and from Harborside Drive should be addressed more specifically.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* (previously the GEIR) and its updates.

LETTER 124

Secretary of Environmental Affairs
Attn.: MEPA
Mr. Arthur Pugsley
EOEA #10458
100 Cambridge St. - 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

124.1

We, the undersigned executive board members of LAMCO (Logan Airlines Management Council), wish to express our support for the series of airside improvements currently proposed by MASSPORT. In an effort to reduce delays and improve efficiency on Logan's airfield, we support the following projects:

*Construction of a uni-directional runway 14/32 for over the water operations.

*Construction of a centerfield taxiway to reduce taxiway congestion.

*Realignment and extension of existing taxiways to enhance airfield safety.

*Reduction of approach minimums on runways to upgrade Logan Airport to industry standards.

The Logan Airlines Management Council is comprised of the following member carriers:

Aer Lingus	Air Canada
Air France	America West
Alitalia	American
Atlantic Coast Airlines	

Logan Airlines Management Council

Dear Mr. Pugsley:

We, the undersigned co-chairpersons of the LAMCO (Logan Airlines Management Council) Cargo sub-committee wish to express our support for the series of airside improvements currently proposed by Massport. In an effort to reduce delay and improve efficiency on Logan's airfield, we support the following projects: 125.1

⇒ Construction of an uni-directional runway 14/32 for over the water operations.

⇒ Construction of a centerfield taxiway to reduce taxiway congestion.

⇒ Realignment and extension of existing taxiways to enhance airfield safety.

⇒ Reduction of approach minimums on runways to upgrade Logan Airport to industry standards.

On behalf of our Customers, who annually ship over 814 million tons of cargo and mail in and out of Logan Airport, we strongly reiterate our support for the Logan Airside Improvement Planning Project (EOEA #10458).

Boston, MA 02205

Dear Mr. Pugsley:

Please accept this letter as a comment on Logan Airport's Airside Improvements Project. There have been many comments made by various officials regarding Massport's dedication and commitment to a regional approach for the mitigation of impacts.

I wish to assure you as Director of Manchester Airport that for the past five years Massport has worked diligently with the regional airports of New England in an effort to find some regional solutions to the congestion at Logan Airport. These meetings have resulted in various approaches for many of the regional airports depending upon their ability to take on more traffic, and their proximity to Logan Airport. Massport's work with Worcester Airport is well noted and I need not comment on it here. 126.1

The unprecedented growth at T.F. Green in Providence and Manchester Airport in New Hampshire is a testament to the regional approach we all have been taking. However, one must understand that Logan's Airside Improvements are complimentary to the hundreds of millions of dollars of improvements already done at T.F. Green and Manchester Airport. One will not work without the other. For airports that are further away in distance from Logan, peak hour pricing is a very viable and supportable solution. 126.2 126.3

I cannot reiterate strongly enough how much Massport has been involved in the regional attempt to mitigate traffic congestion, but, I must also strongly emphasis that no matter how much increased air traffic Providence and Manchester may be able to manage, Logan must still improve its airside efficiency. 126.4

I am moving on to become the Director of Philadelphia International Airport where, by the way, a uni-directional commuter runway is under construction for exactly the same reasons Logan is seeking to do the same.

If you have any questions, please do not hesitate to call me at Philadelphia International Airport.

Sincerely,

Alfred Testa, Jr.
Airport Director

AT/ds

cc: Betty Desrosiers/Massport

Robert Durand, Secretary
Executive Office of Environmental Affairs
Arthur Pugsley, EOEA #10458
100 Cambridge St., 20th Floor
Boston, MA 02202

Attention: MEPA Unit

Re: **EOEA #10458, Logan Airside Improvements, Boston and Winthrop**

Dear Secretary Durand:

On behalf of the Massachusetts Audubon Society, I submit the following comments on the Draft Environmental Impact Report/Environmental Impact Statement (DEIR/EIS) for the above-referenced project.

The Massachusetts Audubon Society has not conducted an in-depth review of this document, therefore our comments will be limited to two aspects: general transportation planning issues and proposed rare species impact mitigation.

Transportation Planning

Massport has proposed these airside improvement to alleviate current and future delays at Logan. Meanwhile, other related planning and transportation activities are ongoing, including the proposal for Massport to take over management of Worcester Airport, discussion of the roles of regional airports both within Massachusetts and in neighboring states, provision of high speed rail service to New York, and the North-South Rail Link project. All of these projects and activities have some bearing on the congestion situation at Logan. There are also environmental and community impacts associated with many of the alternatives under consideration, particularly the aviation alternatives. Decisions on the future configuration of the commonwealth's and New England's transportation networks have huge implications for land use and environmental quality. These decisions should not be based only on an uncoordinated series of independent environmental reviews for specific alternative projects. There should be some more centralized, organized approach which fully engages the public. The Massachusetts Environmental Policy Act (MEPA) process is a good mechanism for public participation, and we urge you to determine means of better coordinating the state's transportation improvement planning processes through MEPA. 127.1

The Draft EIR/EIS shows that alternatives to aviation travel, including increased reliance on rail and video conferencing, may divert up to 7.3 million passengers away from Logan in the year 2010 (Table 2.4-9). Nearly half of this diversion amount is attributed to diversion to other regional airports, which will transfer some of the impacts to other sites without fundamentally alleviating aviation impacts such as noise impacts on neighborhoods. However, this analysis does indicate that Logan passenger demand in 2010 may only increase to 30.2 million compared to 29 million today. Thus, it is clear that alternatives analysis

is critical for finding the region's most environmentally sound transportation solutions, and that this analysis must include consideration of other modes including the effects of two major rail projects: high speed rail to New York and the North-South Rail Link. Other options such as peak pricing deserve further consideration as well. At the same time, it should be recognized that some options, like the proposed expansion of the New Bedford airport, will have insignificant impacts on Logan's congestion situation (potentially diverting one cargo flight per day) while resulting in tremendous environmental impacts. The New Bedford project entails the largest wetland fill ever proposed in Massachusetts since the Wetlands Protection Regulations were promulgated in 1983. The relative utility and impacts of the full range of alternatives (aviation and non-aviation) should be considered and subjected to public review through the MEPA process. 127.2 127.3 127.4

Rare Species

Habitat of rare grassland birds, notably the state-endangered upland sandpiper, would be destroyed by the proposed central taxiway. The DEIR/EIS mentions the possibility of restoring grassland habitat at Camp Edwards on Cape Cod as part of a mitigation package for these impacts. One rational for off-site mitigation (or off-site mitigation combined with on-site mitigation) is the high risk of bird/aircraft collisions due to the high volume of flights at Logan. However, this off-site mitigation proposal requires substantial additional consultation among Massport, Massachusetts Natural Heritage and Endangered Species Program (MNHESP), and the military officials who control Camp Edwards. While off-site mitigation has the potential to benefit rare grassland birds, there are many details which remain unresolved, including permission for Massport to undertake such activities on Camp Edwards land and requirements for undertaking, monitoring, and maintaining grassland restoration. Massport should be required to pursue those consultations actively, and to submit a near-final, detailed mitigation plan with the Final EIR/EIS. 127.5

Conclusion

Many transportation improvement projects, including the proposed Logan expansion and some of the alternatives proposed to avoid the expansion, have large impacts of concern to the affected communities. These issues should be addressed in a fair manner, with a level playing field that allows comparison of relative impacts of various alternatives. The FEIR for this project should be required to more fully evaluate the role of Logan within a regional transportation system and to seek options which minimize environmental impacts at all locations. 127.6

Thank you for the opportunity to comment.

Sincerely,

E. Heidi Roddis
Environmental Policy Specialist

127.1	Environmental Review Process	MEPA	Decisions on the future configuration of the commonwealth's and New England's transportation networks have huge implications for land use and environmental quality. These decisions should not be based only on an uncoordinated series of independent environmental reviews for specific alternative projects. There should be some more centralized, organized approach which fully engages the public. The Massachusetts Environmental Policy Act (MEPA) process is a good mechanism for public participation, and we urge you to determine means of better coordinating the state's transportation improvement planning processes through MEPA.	Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.
127.2	Regional Transportation	Regional Airports, Passenger Rail	...[An] alternatives analysis is critical for finding the region's most environmentally sound transportation solutions, and that this analysis must include consideration of other modes including the effects of two major rail projects: high speed rail to New York and the North-South Rail Link. Other options such as peak pricing deserve further consideration as well.	Refer to response to comment 127.1. Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.

Code	Topic 1	Topic 2	Comment	Response
127.3	Regional Transportation	Regional Airports	...the proposed expansion of the New Bedford airport, will have insignificant impacts on Logan's congestion situation (potentially diverting one cargo flight per day) while resulting in tremendous environmental impacts.	Comment noted.
127.4	Environmental Review Process	MEPA	The relative utility and impacts of the full range of alternatives (aviation and non-aviation) should be considered and subjected to public review through the MEPA process.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
127.5	Ecosystems	Rare Species	While off-site mitigation has the potential to benefit rare grassland birds, there are many details which remain unresolved, including permission for Massport to undertake such activities on Camp Edwards land and requirements for undertaking monitoring, and maintaining grassland restoration. Massport should be required to pursue those consultations actively, and to submit a near-final, detailed mitigation plan with the Final EIR/EIS.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
127.6	Environmental Review Process	MEPA	The FEIR for this project should be required to more fully evaluate the role of Logan within a regional transportation system and to seek options which minimize environmental impacts at all locations.	In accordance with the MEPA Certificate on the Airside Project Draft EIS/EIR, the Supplemental DEIS/FEIR contains a summary of the environmental impacts of growth at the regional airports, based on existing available environmental documents and studies. Refer to Appendix B of the Supplemental DEIS/FEIR.

RE: Draft EIR/EIS
Logan Airsides Improvement Project

Dear Sirs:

The Board of Directors of the Massachusetts Business Roundtable, a statewide organization of seventy-five of Massachusetts' leading chief executives, has recently voted unanimously to strongly support the opening of runway 14/32 and the creation of a new taxiway at Logan International Airport. 128.1

Over the last decade, the Governor and the Legislature have accomplished a great deal to improve the ability of Massachusetts' businesses to grow, create jobs, and compete with companies based in other states and around the world.

However, the growth of our current economy will not continue forever and, not withstanding the efforts of the Legislature and the Governor, Massachusetts has higher costs of living and of doing business than almost any other state in the country. Predictable and efficient air travel for employees, customers and goods are a key component of any company's ability to grow and to compete. This runway will help our state leaders to prepare for the future and to ensure that Massachusetts businesses have a level playing field to compete and create jobs, even in less positive economic times. 128.2

This proposal is not an expansion of Logan and will not result in an increase in flights. The reduction of weather related delays will enhance safety, allow Massport to utilize Logan's existing allowable daily capacity to its utmost, and have a positive ripple effect on other airports on the East Coast. It will reduce air and noise pollution over surrounding residential areas, and move a greater number of takeoffs and landings over the harbor.

The ability of Massachusetts' businesses to expand and to create jobs, in good times and bad, depends on their ability to move employees, customers and goods into and out of Massachusetts. The efficient use of Logan's existing

capacity, through this runway and taxiway, will allow our businesses to continue to create jobs here in Massachusetts and to compete nationally and around the world.

The Massachusetts Business Roundtable would be pleased to work with you in any way to address this critical issue.

Sincerely,

Nader Darehshori

Re: Massachusetts Port Authority (MPA) Logan Airside Improvements Planning Project ("Project") DEIS/DEIR - **EOEA No. 10458**
Boston-Logan International Airport

The Massachusetts Chapter of the Sierra Club (the Club) with over 20,000 members, including the Greater Boston Group with over 7,000 members, request that the Secretary of Environmental Affairs (the Secretary) and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed; that the document be found "**INADEQUATE**"; and that a new Draft document be required. Each of the major three parts; the proposed runway 14/32, the centerfield taxiway between the 4/22 runways, and the lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed. In addition, the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to at least 2020. 129.1 129.2 129.3

The Club furthers wishes to go on record concerning the conflict of interest that exists for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. We strongly request that the EPA take the lead role for any decision making because of this conflict. 129.4

Please note our major concerns:

1. **A comprehensive Northeast regional transportation plan, including all forms of transportation, needs to be developed and subjected to public review before any further airport expansion is allowed** 129.5

The study area must include the Federal Aviation Administration's **Eastern and New England** regions with a goal of identifying and quantifying long range airside, landside and groundside demand requirements. The present system of piecemeal airport expansion throughout the Northeast has become counterproductive, with each airport justifying projects seemingly based on parochial competition rather than regional cooperation. 129.6

The Club realizes that we are asking for a drastic remedy for what is supposed to be a local issue, but this isn't just a local Massachusetts issue and the answers won't come from just looking at Logan Airport. All throughout the Northeast, the same questions and concerns are being raised by more and more residents and groups as to the environmental and economic consequences of

polices that were put into place many years ago before airline deregulation and the enormous growth of airline traffic. As the DEIS/DEIR reminds us, over 100 homes and a church are to be taken for the expansion of the Manchester, NH airport.

The scope for such a study should include, but not be limited to:

- an inventory of all airports and associated planned regional airside and landside projects.
- existing and planned rail passenger services(both Amtrak and commuter rail).
- an inventory of underutilized railroad rights of way and potential uses.
- an analysis of future high speed rail initiatives.
- an inventory of the existing interstate highway system and any planned system expansion.
- an analysis of regional air cargo demand
- a discussion of how airports with constrained landside expansion potential deal with airside capacity issues. 129.7
- all environmental impacts on wetlands, waterways, flora, fauna, and human, including health studies as well as air, noise and odor impacts.
- potential for future reduction in peak time business trips due to improvements in teleconferencing.
- The implications on regional airside planning of NLA's(New Large Aircraft) - more later.
- The implications on regional groundside planning of the construction of the North/South Rail Link - more later.

This study should be accomplished with the cooperation of all interested parties including, but not limited to, residents, businesses, and organizations.
The goal of the above study would be to determine the least invasive environmental impacts of future transportation developments needed to meet the region's requirements for future long term growth. Segmental planning cannot and should not be tolerated.

2. The North/South Rail Link must be a integral part of the planning process for Logan or any other regional airport expansion projects. 129.8

The ridership figures referenced in Massport's DEIS/DEIR for the proposed North/South Rail Link project are in ***draft*** form and have not been reviewed by the Rail Link CAC (Citizen's Advisory Committee) established by EOEA as part of an ongoing process to evaluate the MIS(Major Investment Study)/DEIS/DEIR(**EOEA 10270**) for the Rail Link project. Members of the Rail Link CAC have serious concerns with the intercity(Amtrak) numbers for trips originating and terminating north of Boston, as well as potential diversions from airside demand. 129.9
The Club feels that the low estimates for Rail Link airside Logan diversions have more to do with artificial constraints, primarily parking supply, than with actual Northeast Corridor ridership potential. For example, lack of sufficient parking for Amtrak riders at Route 128 Station has long been considered to be a formidable disincentive for potential rail passengers. The provision of adequate parking at the new Woburn Transportation Center(tentatively identified in the draft Rail Link MIS/EIS/EIR as the initial terminus of Amtrak's high speed service) should generate significantly more airside diversions from Logan than presently referenced.
With the Rail Link in place, New York City will be accessible in about three and one half hours from Woburn! With the Rail Link in place, proposed T.F. Greene commuter rail service from Boston could be extended to any number of Northside destinations! With the Rail Link in place, some Amtrak Northeast Corridor services will be extended to Portland Maine and beyond; while others could be extended into Nashua, New Hampshire and beyond!
In any case, Massport's DEIS/DEIR should be withdrawn pending the completion of the Rail Link MIS/DEIS/DEIR, and the incorporation of its findings into a regional transportation study. 129.10
The Rail Link CAC is also concerned that the MIS/DEIS/DEIR for the Rail Link project is significantly behind schedule. This sorry state of affairs seems to be due more to internal

Massachusetts political squabbling over funding for future local Boston transit projects, rather than as a judgment of the potential value of the Rail Link.
The Rail Link has always been recognized as a project of ***"Regional and National Significance"*** and not just as a local Boston transit project. Funding for the Rail Link must be on a regional basis and be based on the benefits accruing to the entire Northeast, as well as Massachusetts, from the extension of Amtrak's Northeast Corridor to the north of Boston.

3. **The impact of New Large Aircraft (NLA) must be quantified as to their impacts on Logan and other regional airports.** 129.11

There is another trend that impacts the 14/32 runway project.
According to sources in the aviation community, 2003 will see the start of commercial availability of NLAs from Boeing and Airbus Industrie, i.e. New Large Airplanes with a capacity of up to 1000 persons per airplane and needing runways up to 11,000 feet in length. It is inconceivable that Massport is not engaged in some sort of internal planning process with the aim of accommodating NLAs though so far there has been no mention. Since NLAs take a lot of space on the ground, 14/32 might be important to provide more runway and taxiway space for the safe and efficient operation while NLA aircraft use existing runways. These existing runways would need to be extended for the NLAs and many small to medium aircraft would be diverted to 14/32. In short, 14/32 would help clear the way for NLAs at Logan.
It follows that the accommodation of NLAs at Logan will affect terminal building layout and construction, and all aspects of ground transportation.
It is important to ask Massport to describe what plans, if any, have been made to address the impacts of NLAs. And if such an effort is ongoing, the result is segmentation of the EIS/EIR process which is not legal, especially when the runway 14/32 project would be a small part of an EIS/EIR looking at Logan expansion as a whole. 129.12

4. **The reopening of a discussion regarding the construction of a second major airport is counterproductive at this time and would preclude the discipline necessary for any true analysis of transportation alternatives.** 129.13

5. **Any discussions of future regional airport development must be based on reality and not just on wishful thinking.**

The Sierra Club and others are presently contesting New Bedford's proposed airside expansion due to the significant amount of wetlands filling involved. Because of our environmental concerns, the Club has had to review the "purpose and need" justification for this project, and we have yet to find any overwhelming economic "need" that would necessitate the proposed action. Yet, New Bedford, as well as other regional airports, continue to pop up as potential candidates for everything from commuter to air cargo operations.

Additional concerns are as follows.

The MPA makes the claim in their transmission letter of February 19, 1999 that, "...the lapse of time between the publication of the ENF and the publication of notice availability of this Draft EIR ***has no adverse environmental consequences...***" This is very much open to discussion as weather conditions alone have dramatically changed over the last five years because of the El Nino and La Nina effects. FAA delay data (DELAYSIM) shows that Logan's delay situation has improved since 1993 and is essentially in equilibrium. The entire analysis in the document needs to be updated. 129.14
The Sierra Club urges the Secretary and FAA to require the MPA to change the base year for planning for the project to calendar year 1998; to revise all presentations in the DEIS/DEIR, including the appendices thereto, to reflect the changes; to extend the planning period to 2020 129.15

from 2010 with concomitant revisions in projected levels of activity and impact and to require that the DEIS/DEIR be republished.

Massport has not met the requirements of the National Environmental Policy Act (40 CFR Part 1502 Environmental Impact Statements) which requires:

1. the DEIS/DEIS to ***"Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated".*** [i] 129.16

A reasonable person could expect the DEIS/DEIR alternatives to include, but not be limited to, the following:

- Consideration of Implementing a High-Density Rule (Slots). 129.17
- Consider Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan in order to provide noise relief to affected communities.
- Thorough regional transportation planning, including rail, and that all environmental impacts be addressed

2. regarding methodology and scientific accuracy, that, ***"...They shall identify any methodologies used and shall make explicit reference by footnote to the scientific and the sources relied upon for the conclusions in the statement".*** [ii]

The DEIS/DEIR does not indicate the detailed methodology used to develop the levels of passenger forecasts presented. 129.18

3. the environmental consequences regarding the following, ***"The discussion will include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, the relationship of long-term productivity, and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented. It shall include discussions of: ...(g) Urban quality, historic and cultural resources, and the design of the built environment...".*** [iii]

The DEIS/DEIR discusses the preferred alternatives effect on historic districts but does not comment on the urban quality, or the design of the built environment. Although Peak Hour Pricing in Alternate 1 clearly shows to be the most beneficial for delays and thus, noise reduction, the MPA continues not to consider this alternative except as a future option. 129.19 129.20

4 ***"An agency shall commence preparation of an environmental impact statement as close as possible to the time the agency is developing or is presented with a proposal (PP 1508.23) so that preparation can be completed in time for the final statement to be included in any recommendation or report on the proposal. The statement shall be prepared early enough so that it can serve practically as an important contribution to the decision making process and will not be used to rationalize or justify decisions already made." PP 1508.23 describes a proposal as the following: " 'Proposal' exists at the stage in the development of an action when an agency subject to the Act has a goal, is actively preparing to make a decision on one or more alternative means of accomplishing that goal, and the effect can be meaningfully evaluated."*** [iv]

The ENF Certificate was issued November 22, 1995. The MPA and the FAA have not complied with the required timing of the DEIS/DEIR document. Furthermore, the analysis uses baseline 129.21

data of 1993 for a document submitted in 1999. Weather, as well as aircraft and major regional infrastructure and have occurred to the point where a 1998 base year should be required. 129.22
A lack of "reasonable alternatives" exists because of the lack of an assessment of the entire Northeast regional transportation system, the documentation of the history of PRAS and the problems of implementation. The surrounding communities cannot continue to absorb the landside growth that would accompany the proposed airside growth at the airport. 129.23 129.24

There should be a detailed analysis of the causes of the delays in the document which show aircraft mechanical problems, crew caused delay, and weather causes both at Logan and those caused by weather at other airports. This analysis is outdated and inadequate. 129.25

Lowering of the minimum on runway 22L is an additional concern of the Sierra Club for the near in neighborhood of the Saratoga Street area of East Boston. Not only does this allow for an increased number of flights to land at Logan Airport, it also will spread the noise from the missed approach aircraft more horizontally thus impacting the neighborhood at the end of runway 22L with increased noise. Further computer modeling does not present the real life occurrence in the surrounding communities and a more accurate analysis needs to be done. Communities constantly challenge the 65 db contour lines with regards to soundproofing which does not include air conditioning and which requires that the residence meet current code guidelines. That can cause financial stress on the already noise impacted residents. 129.26

The proposed centerfield taxiway between runways 4L/22R and 4R/22L leads to further increased operations at Logan Airport and increased noise for the close in residents of Winthrop, Revere, and East Boston. This taxiway will allow for additional queuing of aircraft very close to the surrounding neighborhoods and Constitution Beach, increased operations which will increase noise and further degrade the quality of life for these residents. 129.27

Boston as an historic city will suffer the brunt of negative impacts from the proposed Project and will lose a quality of life that will never be recaptured! The additional number of flights, as well as increased traffic, that the Project would allow and encourage will do irreparable harm to the historic city of Boston and the greater metropolitan area. Development of high speed rail connections to other airports and the connection of Boston's two rail stations with the North/South Rail Link could help reduce these impacts. Convention locations and tourist destinations are not determined by the accessibility of an airport, rather they are determined by the quality of the experience of the location. No other major city around the world has had loss of tourists or conventions because of the convenience or inconvenience of the locality's airport. For the MPA to claim that the additional runway and centerfield taxiway are needed for the proposed new convention center is nothing more than an exaggeration. Time and again the MPA has claimed the need for the Project for the good of the city of Boston. With the proposed growth for Logan Airport needless adverse impacts will continue to grow over one of the most historic cities in the country. Mayor Menino does not agree with the MPA hypothesis and neither does the Sierra Club. 129.28 129.29 129.30

Massport and the FAA both state ***"when dealing with an existing airport (such as Logan Airport) within an urban setting (such as metropolitan Boston), any change in operating conditions aimed at more equitably distributing noise impacts (here, in accordance with the PRAS goals) may result in some increase in noise at specific historic areas while at the same time decreasing noise at other historic areas."*** [v]
The Sierra Club believes that changes to Logan's operating conditions are not any more important than the cultural, historical and urban quality of life in the metropolitan Boston area.

The state listed endangered upland sandpiper habitat which would be disrupted by the enterfield taxiway is not adequately addressed and there is no agreement with the Massachusetts Natural 129.31

Heritage and Endangered Species Program although this has been a known area of concern since 1993.

A primary concern for the newly created Boston Harbor Islands National Recreation Area is the proposed construction of runway 14/32 and the resultant 75,000 proposed flights over the newly created Boston Harbor Recreational Area. This impact, one of environmental injustice, would occur to mostly inner city residents who frequent the islands to get away from the noise and hubbub of city life. This is, and should continue to be, a time for them to experience nature, to hear and smell the harbor and study the skies. These sensory experiences would be severely impacted by the exorbitant number of flights over the harbor. 129.32

Children from school groups, Boy and Girl Scout troops, Inner City Outings groups, and many other groups camp and explore the islands and enjoy learning experiences from the skies to the flora and fauna of the islands to the marine life and water quality. All of this will be degraded by the subject project.

The roar of the overhead planes will make a camping experience a horror rather than the wonderful enjoyment of sleeping under the stars. The fuel emissions and dumping from the airplane engines will contaminate the islands and the wildlife, not to mention the humans who will be much more exposed by being out of doors rather than at home or work.

In conclusion, ***The Sierra Club sees this proposed Project as the first step in further major development at Logan airport***, sees a lack of guarantee of the unidirectional use of the proposed 14/32 runway, and believes the lack of future plans and analysis for the airport over the next 20 years must be found and the current document declared inadequate. In addition, ***the public has not been given fair consideration of the proposed Project***. It is merely an interim solution to a much bigger and more complex problem which must be addressed before allowing the project to go forward. In addition the projected growth of jet operations is horrifying. Other alternatives must be assessed. 129.33

Because none of these impacts has been adequately addressed or, in some cases, even mentioned in the DEIS/DEIR, the Sierra Club requests that the Secretary of Environmental Affairs (the Secretary) and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed, that the document be found **"INADEQUATE"** and that a new Draft document be required 129.34

Thank you for this opportunity to comment.

Code	Topic 1	Topic 2	Comment	Response
129.1	Environmental Review Process	FAA/NEPA, MEPA	The Massachusetts Chapter of the Sierra Club...requests the Secretary of Environmental Affairs (the Secretary) and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed; that the document be found "INADEQUATE", and that a new Draft document be required.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
129.2	Alternatives	Preferred Alternative	Each of the major three parts: the proposed runway 14/32, the centerfield taxiway between the 4/22 runways, and the lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed.	Refer to response to comment 129.1.
129.3	Analysis Assumptions/ Methodologies	Base Year	...the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to at least 2020.	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame. Analysis of 1981 to 90 weather with 1989-98 weather identifies no significant differences in statistical properties.
129.4	Environmental Review Process	FAA/NEPA	The Club further wishes to go on record concerning...[there is a] conflict of interest...for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. We strongly request that the EPA take the lead role for any decision making because of this conflict.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
129.5	Regional Transportation	Regional Airports	A comprehensive Northeast regional transportation plan, including all forms of transportation, needs to be developed and subjected to public review before any further airport expansion is allowed.	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market.
129.6	Analysis Assumptions/ Methodologies	Passenger Forecasts	The study area must include the Federal Aviation Administration's Eastern and New England regions with a goal of identifying and quantifying long range airside, landside and groundside demand requirements.	The proposed Logan Airport Airside Project is necessary and provide clear benefits at current traffic levels. Massport has long recognized that service development and increased passenger traffic at the regional airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, especially high-speed rail to Logan Airport's largest market, New York. Section 2.3 of the Supplemental DEIS/FEIR evaluates T.F. Green/Providence, Manchester, and Worcester Regional airports and their potential impacts on Logan Airport. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport but will not eliminate the need for airside projects.
129.7	Regional Transportation	Regional Airports	The scope for such a study should include, but not be limited to: ■ an inventory of all airports and associated planned regional airside and landside projects. ■ existing and planned rail passenger services (both Amtrak and commuter rail). ■ an inventory of underutilized railroad rights of way and potential uses. ■ an analysis of future high speed rail initiatives. ■ an inventory of the existing interstate highway system and any planned system expansion. ■ an analysis of regional air cargo demand. ■ a discussion of how airports with constrained landside expansion potential deal with airside capacity issues. ■ all environmental impacts on wetlands, waterways, flora, fauna, and human, including health studies as well as air, noise and odor impacts. ■ potential for future reduction in peak time business trips due to improvements in teleconferencing. ■ The implications on regional airside planning of NLA's (New Large Aircraft) - more later. ■ The implications on regional groundside planning of the construction of the North/South Rail Link.	The discussion of alternatives in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR responds to federal and state scoping directives and provides appropriate analytical context for assessing the need for the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
129.8	Regional Transportation	Passenger Rail	The North/South Rail Link must be a integral part of the planning process for Logan or any other regional airport expansion projects.	Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.
129.9	Analysis Assumptions/ Methodologies	Passenger Forecasts	Members of the Rail Link CAC have serious concerns with the intercity (Amtrak) numbers for trips originating and terminating north of Boston, as well as potential diversions from airside demand. The Club feels that the low estimates for Rail Link airside Logan diversions have more to do with artificial constraints, primarily parking supply, than with actual Northeast Corridor ridership....	The analysis of regional alternatives presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR relies on air to high-speed rail diversion estimates published in the Supplemental DEIS/FEIR and Section 4(f) Statement, Northeast Corridor Improvement Project, prepared by the Federal Rail Administration in October 1994. In preparing the Supplemental DEIS/FEIR, Massport contacted Amtrak for more recent estimates, but Amtrak did not have any updated ridership estimates that could be released to Massport. Amtrak's written response to Massport's request for updated ridership numbers is contained in Appendix B of the Supplemental DEIS/FEIR. See Appendix B for the latest status of the North-South Rail Link diversion estimates.
129.10	Regional Transportation	Passenger Rail	In any case, Massport's DEIS/DEIR should be withdrawn pending the completion of the Rail Link MIS/DEIS/DEIR, and the incorporation of its findings into a regional transportation study.	Refer to response to Comment 129.9.
129.11	Analysis Assumptions/ Methodologies	Fleet Mix	The impact of New Large Aircraft (NLA) must be quantified as to their impacts on Logan and other regional airports.	So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years. Consequently, the NLA was not included in the Future Fleet scenarios.
129.12	Alternatives	Runway 14/32	It is important to ask Massport to describe what plans, if any, have been made to address the impacts of NLAs. And if such an effort is ongoing, the result is segmentation of the EIS/EIR process which is not legal, especially when the runway 14/32 project would be a small part of an EIS/EIR looking at Logan expansion as a whole.	Refer to response to Comment 129.11.
129.13	Regional Transportation	Passenger Rail	The reopening of a discussion regarding the construction of a second major airport is counterproductive at this time and would preclude the discipline necessary for any true analysis of transportation alternatives.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
129.14	Analysis Assumptions/ Methodologies	Planning Period	FAA delay data (DELAYSIM) shows that Logan's delay situation has improved since 1993 and is essentially in equilibrium. The entire analysis in the document needs to be updated.	Section 1.4 and Appendix C of this Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
129.15	Analysis Assumptions/ Methodologies	Base Year	The Sierra Club urges the Secretary and FAA to require the MPA to change the base year for planning for the project to calendar year 1998; to revise all presentations in the DEIS/DEIR including the appendices thereto, to reflect the changes; to extend the planning period to 2020 from 2010 with concomitant revisions in project levels of activity and impact and to require that the DEIS/DEIR be republished.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.
129.16	Environmental Review Process	NEPA	Massport has not met the requirements of the National Environmental Policy Act (40 CFR Part 1502 Environmental Impact Statements) which requires...the DEIS/DEI[R] to "Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated".	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
129.17	Alternatives	Other Non-Construction Alternatives	...the DEIS/DEIR alternatives...[should] include, but not be limited to, the following: ■ Consideration of Implementing a High-Density Rule (Slots). ■ Consider Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan in order to provide noise relief to affected communities. ■ Thorough regional transportation planning, including rail, and that all environmental impacts be addressed.	Neither federal nor state scoping directives required an analysis of slotting. Imposition of slot controls constitutes a federal policy that has been preempted to the FAA under federal law and is not within Massport's jurisdiction. Congress determined that the slot program has a number of significant problems. The U.S. DOT has studied options for reducing slot controls at airports. As a result, the AIR-21 Act, which was enacted in March 2000, eliminates all slots at three of the nations slot controlled airports. Slots at the Chicago O'Hare airport will be eliminated by July 1, 2002 and slots at New York LaGuardia and New York JFK will be eliminated by January 1, 2007. PPP represents a market approach that should encourage the highest value services to use Logan Airport during periods of scarce capacity without the market disruption and other inefficiencies related to slot control. The phaseout of Stage 2 aircraft operations was complete as of December 31, 1999. Refer to response to Comment 85.26. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
129.18	Analysis Assumptions/ Methodologies	Passenger Forecasts	The DEIS/DEIR does not indicate the detailed methodology used to develop the levels of passenger forecasts presented.	The 29 M level was developed in the *Logan Airside Improvements Feasibility Study*. It represented the growth from 1993 level at the historic (1960 to 1993) average growth rate of approximately three percent annually. The 37.5 M and 45 M levels have been used historically in other planning studies at Logan Airport and represent estimates of future demand under constrained and unconstrained growth scenarios. More information can be found in *Passenger Forecast for Logan International Airport*, Massport, 1991 and in *Logan Airside Improvements Feasibility Study Phase 1 Report*, Massport, July 1995.

Code	Topic 1	Topic 2	Comment	Response
129.19	Open Space/ Parkland	Impacts	The DEIS/DEIR discusses the preferred alternatives effect on historic districts but does not comment on the urban quality, or the design of the built environment.	The proposed projects evaluated under each of the alternatives are located on the existing airfield. Implementation of any of the proposed projects will not physically change the urban characteristics or the design of the built environment within adjacent communities when compared to the No-Action Alternative. Off-airport noise impacts from the Preferred Alternative are discussed in Section 6.2 of the Supplemental DEIS/FEIR.
129.20	Alternatives	Peak Period Pricing	Although Peak Hour Pricing in Alternate 1 clearly shows to be the most beneficial for delays and thus, noise reduction, the MPA continues not to consider this alternative except as a future option.	See Section 4.5 of the Supplemental DEIS/FEIR.
129.21	Environmental Review Process	FAA/NEPA, MEPA	The MPA and the FAA have not complied with the required timing of the DEIS/DEIR document.	Massport and FAA have complied with all applicable state and federal requirements.
129.22	Analysis Assumptions/ Methodologies	Base Year	...a 1998 base year should be required.	Refer to response to Comment 129.15.
129.23	Environmental Review Process	NEPA	A lack of "reasonable alternatives" exists because of the lack of an assessment of the entire Northeast regional transportation system, the documentation of the history of PRAS and the problems of implementation.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
129.24	Cumulative Impacts	Landside Improvements	The surrounding communities cannot continue to absorb the landside growth that would accompany the proposed airside growth at the airport.	The Airside Project has independent utility from existing and proposed landside projects at Logan Airport. The proposed improvements analyzed in the Supplemental DEIS/FEIR involve both construction and administrative actions that will facilitate aircraft operations (landings, takeoffs and taxiing). None of the improvements involve landside facility improvements (*e.g.*, terminals and roadways) or related operations. The Supplemental DEIS/FEIR analyzes in detail the impacts from aircraft operations, including analysis of noise and air quality impacts during the years 1993, 1998 and under future forecast scenarios as well as environmental benefits from certain of the improvement concepts under review. In this respect, the Supplemental DEIS/FEIR conforms with scoping directives from the lead federal agency (the FAA) and with applicable FAA environmental orders, all issued in accordance with NEPA, and with directives from EOEA issued under MEPA. The various GEIR documents, including the *Logan Airport 1998 Annual Update* and the *1999 Environmental Status and Progress Report* (previously GEIR), provide additional analytic context by examining cumulative impacts from airside (*i.e.*, aircraft) operations and landside (*e.g.*, vehicular traffic, terminal service vehicles) operations at Logan Airport as well as Massport's comprehensive mitigation program. The ESPR/GEIR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR as a background document. Each GEIR/ESPR submission is subject to public review and comment. The *Logan Airport 1998 Annual Update* and the *1999 ESPR* analysis is based on the same forecast levels used in the Supplemental DEIS/FEIR. The GEIR/ESPR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Supplemental DEIS/FEIR. Consistent with past practice, Massport expects that the FAA will take the GEIR/ESPR analysis into account during its deliberations and ultimate decision on the Supplemental DEIS/FEIR.
129.25	Delay	Model	There should be a detailed analysis of the causes of the delays in the document which show aircraft mechanical problems, crew caused delay, and weather causes both at Logan and those caused by weather at other airports.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
129.26	Alternatives	Reduced Approach Minima	Lowering of the minimum on runway 22L [will cause increased noise]...the near in neighborhood of...Saratoga Street area of East Boston.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.

Code	Topic 1	Topic 2	Comment	Response
129.27	Alternatives	Taxiway Improvements	The proposed centerfield taxiway between runways 4L/22R and 4R/22L...will increase noise and further degrade the quality of life for [residents of Winthrop, Revere, and East Boston]....	Section 6.2 of the Supplemental DEIS/FEIR shows that there are small noise benefits from the construction of the Centerfield Taxiway. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the taxiways reducing ground noise and emissions for close in residents of East Boston and Winthrop. It also should eliminate aircraft landing on Runway 4R from waiting to cross Runway 4L and aiming their intake noise toward Constitution Beach. Section 6.4 of the Supplemental DEIS/FEIR discusses the air quality benefits of the Centerfield Taxiway.
129.28	Open Space/ Parkland	Impacts	Boston as a historic city will suffer the brunt of negative impacts from the proposed Project....	The FAA and Massport have consulted with the Massachusetts Historical Commission (MHC). The MHC has concurred with the FAA's determination that the Preferred Alternative will have no adverse effect on significant historic properties. Refer to Section 6.3.2 of the Supplemental DEIS/FEIR for a description of historic properties, project impacts and mitigation.
129.29	Regional Transportation	Passenger Rail	Development of high speed rail connections to other airports and the connection of Boston's two rail stations with the North/South Rail Link could help reduce these impacts.	Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
129.30	Ground Transportation	Access to Logan	[The convenience level of a city's airport has no effect on tourism or convention business.]	The delay analysis presented in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR clearly indicates that delays will increase in the future if Runway 14/32 is not built. Section 1.2 of the Airside Project Draft EIS/EIR and Section 1.3 of the Supplemental DEIS/FEIR discuss the importance of Logan Airport to the regional economy. Refer also to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of the delays that would occur under future scenarios if no actions were taken, and the delay reduction benefits of the Preferred Alternative.
129.31	Ecosystem	Rare Species	The state listed endangered upland sandpiper habitat which would be disrupted by the centerfield taxiway is not adequately addressed and there is no agreement with the Massachusetts Natural Heritage and Endangered Species Program....	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
129.32	Alternatives	Runway 14/32	[The proposed new runway will have a very adverse impact on the Boston Harbor Islands National Recreation Area including increased noise, scenic, water quality, and wildlife impacts.]	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
129.33	Environmental Review Process	Public Process	...the lack of future plans and analysis for the airport over the next 20 years must be found and the current document declared inadequate. In addition, the public has not been given fair consideration of the proposed Project. It is merely an interim solution to a much bigger and more complex problem which must be addressed before allowing the project to go forward.	Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts. There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
129.34	Environmental Review Process	MEPA	Because...impacts ...[have not] been adequately addressed....the documents [should] be found "INADEQUATE" and ...a new Draft document [should] be required.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

LETTER 130

BRIEFING REPORT

State of the State: The Need for Logan Airport Improvements

EXECUTIVE SUMMARY

Improvements at Logan Airport Badly Needed. With an annual economic impact of $5 billion, Boston Logan International Airport is at the heart of the region's economy. But in 1998, Logan experienced more than 120,000 hours of delay, making it the sixth-worst airport for delays in the nation. The annual cost of those delays to airlines and passengers? An estimated $310 million.

Surprising Reason for Logan Delays: Wind. The layout of Logan's four major runways means that when strong winds blow from the northwest, only one or two of the existing runways can be used. The normal of capacity 120 takeoffs and landings per hour drops to 90 or even 60, causing huge traffic delays.

New Over-Water Runway Is the Key to Improvement. Massport has proposed a series of airside improvements to reduce delay and improve efficiency on Logan's airfield. The centerpiece would be a new 5,000-foot commuter aircraft runway with all arrivals and departures occurring over water. The new runway would reduce delays up to 90 percent on northwest wind days, by more than 50 percent on good weather days, and by up to 25 percent annually.

Other Airports Can Help But Not Enough. Passenger growth in 1998 was up 75 percent at Manchester Airport and 14 percent at T.F. Green Airport (R.I.), making them two of the fastest growing regional airports in the country. Hanscom Field already is the second largest New England airport in landings and takeoffs. This growth helps to siphon off some of Logan's congestion but is not enough to make a serious dent in Logan's delays.

Public Overwhelmingly Favors Airport Improvements. 70 percent of citizens statewide consider Logan Airport very important to the region's well being, and 88 percent of the public favors a program to modernize Logan. 62 percent of Massachusetts residents and 52 percent of those in Boston support the new runway construction, specifically.

Logan Upgrade Helps Residents and Job Growth. A more efficient and hassle-free Logan made possible by airside improvements will support business expansion and job growth, the new convention center and Boston's Seaport District. At the same time, the new runway will spread noise impacts more equitably across communities near the airport and shift 75,000 flights over water—and that benefits everyone. The new runway also will improve air quality by reducing aircraft queuing, idling and circling overhead.

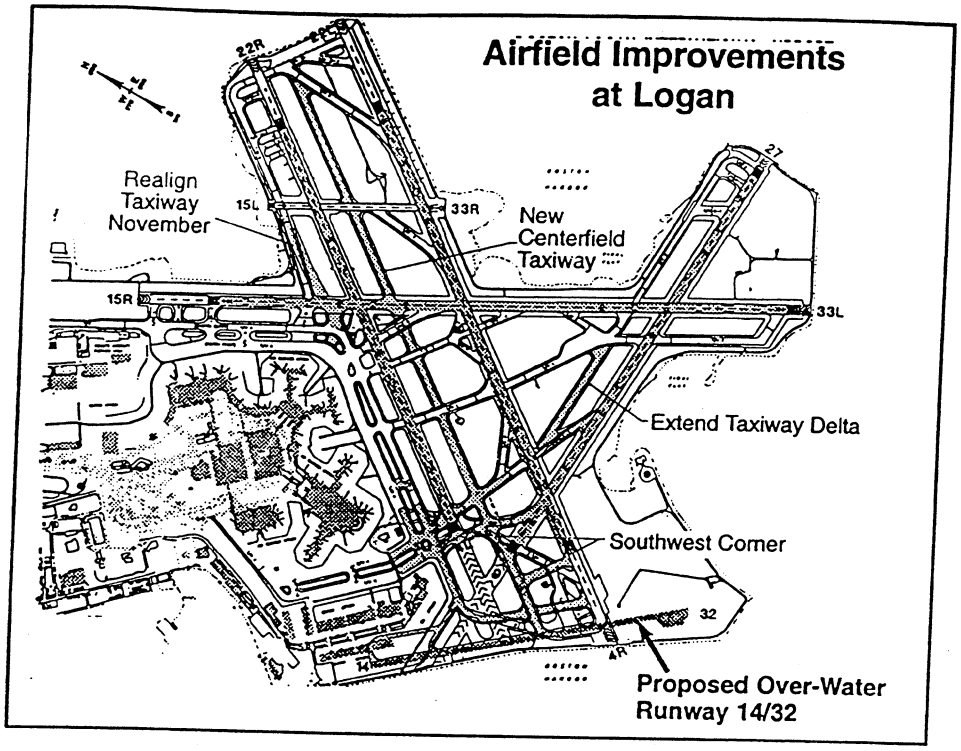
A Corporate Client Report
Vol. 10, No. 1 March 1999

On February 24, Boston Edison was pleased to host Mass Insight's annual winter review of the state's public policy agenda, with a special focus on the proposed new runway at Logan Airport. This briefing report summarizes the Logan Airport issues and includes highlights of the Mass Insight winter public opinion research on Logan and other public priorities.

At the briefing, **Betty Desrosiers**, director of aviation planning and development for Massport, presented the new runway project at Logan Airport. **Mark Robinson**, chairman of Massport, and **Gloria Larson**, chairman of the Mass. Convention Center Authority, emphasized the critical importance of the project for the state. Business initiatives to generate support were outlined by **Alan Macdonald**, executive director of the Massachusetts Business Roundtable, **Brian Gilmore**, executive vice president of Associated Industries of Massachusetts, and **James Klocke**, director of government affairs and economic development for the Greater Boston Chamber of Commerce.

As chair of the Mass. Business Roundtable's Transportation Committee, I know that improving Logan is one of the most important infrastructure projects under discussion now. Public opinion favors the effort, but it will be critical for business, state and local leaders to speak out at upcoming public forums on the issue, including NEPA/MEPA hearings on April 7 at 6:30 PM at the State Transportation Building in Boston and on April 8 at 6:30 PM at the Holiday Inn, Route 1A North in East Boston.

Thomas May
CEO, Boston Edison



THE ISSUE: LOGAN AIRFIELD LAYOUT LEADS TO POOR SERVICE—AND THE PUBLIC SUFFERS

Delays at Logan Are Five Times the Congestion Minimum and Costly. Logan's 120,000 hours of delay in 1998 were at five times the FAA threshold for congestion. Delays cost Massachusetts businesses, passengers, and airlines more than $300 million annually. High-growth industries in particular depend on Logan—business, management and financial services, high tech and communications. 78 percent of local businesses expect their demand for air travel to increase over the next five years.

Wind and Airfield Layout the Culprits. Logan has four major runways. The FAA tower uses three runways at a time to accommodate 120 takeoffs and landings per hour. Under these conditions, demand can be accommodated with little delays. But when strong winds come from the northwest, one or two of the runways become unusable, making operations plunge to between 60-90 per hour. Even when the weather is clear, airplanes at Logan can end up taking off late, and planes in other airports embarking for Boston remain grounded.

The Public Sees Logan as Non-Competitive. 43 percent of Massachusetts residents feel that Logan Airport is worse than other airports, 27 percent feel it is better, and 14 percent believe it is about the same as other airports. Among airport users, negative ratings jump. 53 percent of people using Logan one to five times in the last year say it is worse than other airports.

Delays Create More Noise for Logan's Neighbors. Residents in communities surrounding the airport suffer from delays. Late daytime schedules mean planes continue operations later at night. The lack of a third east-west runway forces the FAA to rely heavily on Logan's north-south oriented runways, significantly impacting communities to the north and south. This also limits how often planes can takeoff and land over the water.

LOGAN IMPROVEMENT IS CRITICAL TO THE REGION'S COMPETITIVE ADVANTAGE

Job Growth Hinges on Improvements. Boston-area businesses surveyed said that dependable and frequent air service is the second-most important factor when considering where to locate a business. A delay-prone airport alienates executives considering Massachusetts as a home base and undermines Boston's new convention center and Seaport District. No significant improvements have been made to Logan's airfield in more than 25 years. Other major U.S. cities are investing in new runways to enhance their airports; Boston must do the same to remain competitive.

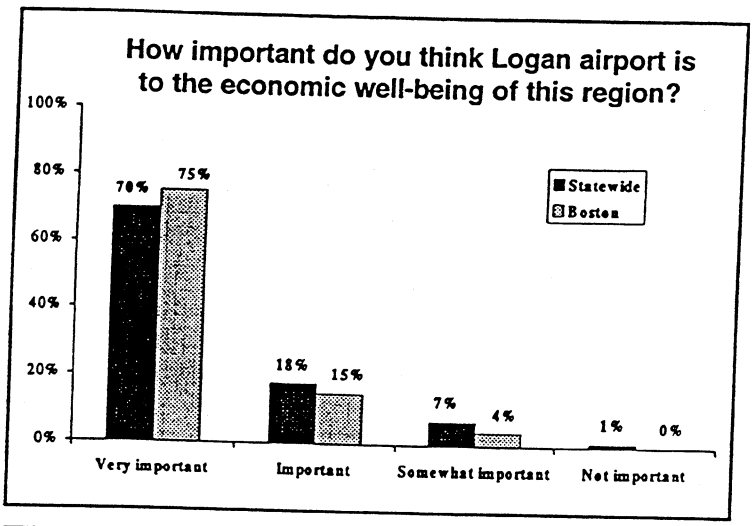
Logan Airport Creates Jobs and Revenue Directly. Logan supports more than 100 airport-related businesses and provides jobs for more than 15,000 employees. Airport payroll, local purchases, and taxes translate to $1.4 billion, while visitor expenditures, travel commissions and related revenue generate another $3.6 billion.

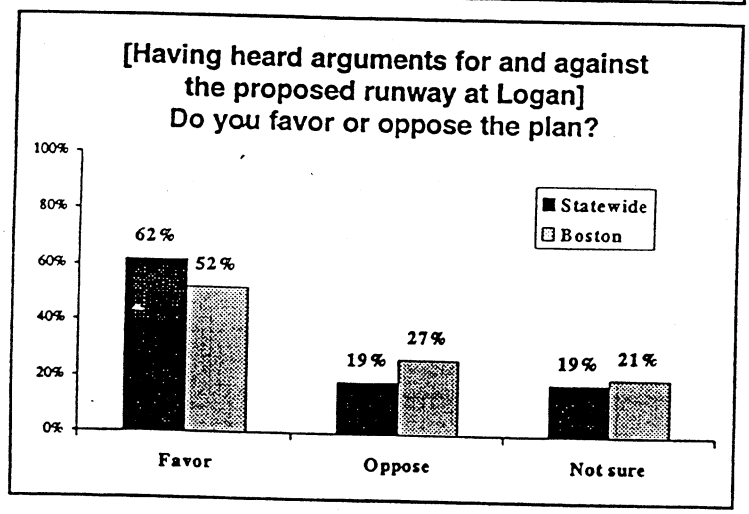
Public Sees Logan's Importance to Residents and Businesses. More than half (56 percent) of Massachusetts residents have used Logan airport in the past year. 86 percent of the public consider the airport to be important to the economic well being of the region; the number is even higher in Boston. One-third of state residents consider Logan to be important to their employers. In Boston, nearly half (47 percent) see the airport as important to their business.

OVER-WATER RUNWAY 14/32: THE KEY TO IMPROVEMENT

New Over-Water Runway Is the Critical Element. One of the key solutions Massport has proposed to increase

efficiency at Logan is the uni-directional over-the-water runway 14/32. The new runway 14/32 would reduce delays up to 90 percent on northwest wind days. Flights to Logan are expected to grow at about 1.5 percent annually. That's because Boston has a vibrant economy and is one of the most popular destinations for business and leisure travel in the U.S. Runway 14/32 will allow the FAA to better manage the traffic that is coming anyway and distribute flights more equitably over nearby neighborhoods, reducing persistent noise over any one community.





Other Airside Improvements Support the New Runway. Proposed improvements to Logan also include a centerfield taxiway, which would reduce taxiway congestion and ease movement of aircraft between terminal areas and runways. Proposed changes would also lower approach minimums—the point at which a pilot must decide whether to abort a landing—for Logan's runways. Reduced minimums will further ease delays, enhance safety and improve operational flexibility by giving air traffic controllers a choice of runways under poor weather conditions.

ALTERNATIVE SOLUTIONS ARE NOT ENOUGH

Relief Provided by Other Airports Necessary But Not Sufficient. Hanscom Field is already the second busiest New England airport in operations, serving the corporate market. Passenger growth in 1998 was up 75 percent at Manchester, N.H., Airport and 14 percent at T.F. Green (Providence) Airport, siphoning off some of Logan's congestion. Planned expansion at Worcester and New Bedford airports can help. However, Logan will remain the region's hub airport, and none of these developments will sufficiently decrease delays at Logan.

Peak-Period Pricing Doesn't Address the Problem. Pricing landing/takeoff fees higher at peak-travel times will not address weather-related delays, which are the principal cause of slowdowns at Logan. In addition, the costs to important regional carriers, such as Cape Air and Business Express, could be devastating.

PUBLIC SUPPORT, EVEN IN BOSTON, FOR THE PROJECT

Public Strongly Favors Modernization. 88 percent of the public favor a program to improve Logan. The public strongly supports the construction of a new runway: 62 percent are in favor, 19 percent oppose it, and 19 percent are unsure. Even in Boston, the majority (52 percent) are in support of a new runway, while 27 percent oppose it.

Gaining Momentum for the Project. Massport has filed the Environmental Impact Statement Report for the Logan Airside Improvements Planning Project, as it is called, to the appropriate state and federal agencies and hopes to have the project permitted by the end of 1999. In early 2000, Massport will seek relief from a 1975 court injunction, which was based on a petition filed by a community-based organization opposing construction of the new runway. Design and construction of the runway is planned for 2000-2001 and should be completed within a year. Other improvements will take an estimated three to five years to complete.

Public and Business Support Crucial. The support of business and community leaders is critical at public hearings and in the media. A partial list of hearings includes the NEPA/MEPA hearings on **April 7** at 6:30 PM at the State Transportation Building in Boston and on **April 8** at 6:30 PM at the Holiday Inn, Route 1A North in East Boston. The Greater Boston Chamber of Commerce is coordinating an effort involving the Mass. Business Roundtable, A.I.M. and other advocates.

LETTER 131

MASSPIRG
Massachusetts Public Interest Research Group
29 Temple Place, Boston, MA 02111-1350 (617) 292-4800
http://www.pirg.org/masspirg

TO: Secretary Bob Durand
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

FR: Rob Sargent, Legislative Director

Date: April 23, 1999

Attn: MEPA Unit
Re: Logan Expansion/Runway 14/32

Dear Secretary Durand,

MASSPIRG urges you to reject the Massachusetts Port Authority's (MASSPORT) current Environmental Impact Statement (EIS) on their proposed runway expansion as insufficient. The EIS fails to adequately take into account existing pollution from the airport and the increased pollution from the planned expansion in light of their projected increases in passenger load. The EIS fails to specifically address past commitments that have been made to contain the environmental footprint of the airport. 131.1 131.2

You will hear from many commenters, well documented accounts of the level of current air, water and noise pollution. You will also receive many comments making an assailable argument that MASSPORT has neglected many factors which will contribute to increased pollution resulting from the airport expansion. Therefore, MASSPIRG will limit its comments to a number of conceptual considerations which must be taken into account before approving this EIS or any expansion at Logan Airport

Existing Burdens on the Environment and the Health of the Surrounding Communities

Logan Airport already poses an overwhelming air pollution burden on the communities surrounding it. It is directly responsible for very substantial emissions of smog-causing Nitrogen Oxides, hazardous air pollutants, including known and suspected carcinogens such as benzene and formaldehyde, and fine particulate pollution, a fine soot for which is increasingly known to be directly responsible for premature deaths. 131.3 131.4

Additionally, the airport is responsible for polluted runoff and other pollution of the surrounding harbor.

Past Assurances of No Net Increase in Environmental Impacts

MASSPORT has made statements in the past that it would not expand the "environmental footprint" of the airport. The EIS neglects to address these past commitments. The EIS states that the runway expansion will make the airport more efficient resulting in reduced congestion, idling and circling planes. Yet, it completely ignores the accompanying projections of growth in air traffic. The new runway must be considered in the context of the projected growth. In that light, the new runway can only be seen as an enabler to increased traffic in the absence of a commitment to cap air traffic at existing levels. 131.5 131.6

MASSPORT should not even consider a new runway without adopting policies which incent more efficient use of the runways. 131.7

Any increase in emissions and other environmental and health impacts must be offset by equivalent or greater reductions those impacts in the neighborhoods most directly affected by airport pollution. MEPA should reject any MASSPORT plan which does not contain clearly enforceable plans which adhere to this principle. 131.8

A Clear Accounting for Resources Committed For Past Environmental Mitigation Commitments

Consideration of the assumptions about and promises about future environmental impacts currently being made by MASSPORT cannot be done without a tough look at what has happened in past mitigation efforts.

Past mitigation commitments have included commitments continually increase the mix of passengers reaching the airport by public transit. Substantial resources were have been earmarked for this and other mitigation commitments. MEPA should demand a full accounting where those resources have been spent and where they intend to spend them in the future. 131.9

Flaws in State Transportation Planning

Lastly, the debate over the runway has fueled a much needed debate on transportation planning in the Commonwealth and in the region. This runway, nor any other changes in our tranportation infrastructure, should be considered with a comprehensive assessment of transportation options. 131.10

This must include a well thought out and coordinated regional plan including rail and a balanced use of the region's airports.

Letter 131
MASSPIRG
Rob Sargent, Legislative Director

Code	Topic 1	Topic 2	Comment	Response
131.1	Environmental Review Process	MEPA	The EIS fails to adequately take into account existing pollution from the airport and the increased pollution from the planned expansion in light of their projected increases in passenger load.	The air quality analysis includes all existing sources and future growth at Logan Airport.
131.2	Environmental Review Process	FAA/NEPA, MEPA	The EIS fails to specifically address past commitments that have been made to contain the environmental footprint of the airport.	Massport's airport-wide mitigation commitments are well documented and tracked in the Environmental Status and Planning Report and its annual updates. The Airside Improvements Planning Project proposed recommendations does not include the expansion of the footprint of Logan Airport. Extensive analysis of impacts of the 37.5 million scenario is discussed in detail in Chapters 5 and 6 of the Supplemental DEIS/FEIR.
131.3	Air Quality	Impacts	Logan Airport already poses an overwhelming air pollution burden on the communities surrounding it.	Modeling of air emissions shows no violation of the NAAQS in any areas surrounding Logan Airport.
131.4	Water Quality	Impacts	...the airport is responsible for polluted runoff and other pollution of the surrounding harbor.	Massport presents data regarding outfall monitoring in its GEIR/ESPRs and its subsequent Annual Updates. Similarly, Massport has developed extensive documentation regarding its development of the new salt marsh restoration area along Taxiway November. The Airside Project has been designed in a manner to avoid any wetland or harbor construction and a mitigation program has been developed to ensure that the project will not adversely affect water resources.
131.5	Environmental Review Process	FAA/NEPA, MEPA	Massport has made statements in the past that it would not expand the "environmental footprint" of the airport. The EIS neglects to address these past commitments.	See Response to 131.2. Extensive analysis of impacts of the 37.5 million scenario is discussed in detail in Chapters 5 and 6 of the Supplemental DEIS/FEIR. Extensive analysis of impacts of the 37.5 million scenario is discussed in detail in Chapters 5 and 6 of the Supplemental DEIS/FEIR.
131.6	Alternatives	Runway 14/32	...the new runway can only be seen as an enabler to increased traffic in the absence of a commitment to cap air traffic at existing levels.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.
131.7	Alternatives	Runway 14/32	Massport should not even consider a new runway without adopting policies which incent more efficient use of the runways.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway 14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.

Code	Topic 1	Topic 2	Comment	Response
131.8	Public Health	Effects	Any increase in emissions and other environmental and health impacts must be offset by equivalent or greater reductions [to] those impacts in the neighborhoods most directly affected by airport pollution.	The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.
131.9	Ground Transportation	Access to Logan	Past mitigation commitments have included commitments [to] continually increase the mix of passengers reaching the airport by public transit. Substantial resources were [to] have been earmarked for this and other mitigation commitments. MEPA should demand a full accounting [of] where those resources have been spent and where they intend to spend them in the future.	The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's progress on meeting its air passenger goal of 35.2 percent by the time air passenger volumes reach 37.5 million annual passengers. Consideration will be given to ways to enhance transit ridership and use of the Logan Express bus service. In addition, Massport is considering consolidation of car rental facilities, which will facilitate the consolidation of the courtesy vehicles serving the rental car companies.
131.10	Regional Transportation	Regional Airports	...[The proposed new runway and] any other changes in our transportation infrastructure, should be considered with a comprehensive assessment of transportation options.	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market.

LETTER 132

Secretary of Environmental Affairs
attn: Arthur Pugsley -- EOEA #10458
100 Cambridge Street, 20th Floor
Boston, Mass. 02205

Re: New Runway at Logan Airport; Expansion at S. Weymouth & Hanscom

Dear Mr. Secretary:

I wish to offer some comments regarding the runway expansion at Logan Airport, as well as further observations regarding alternatives for expanded airport capacity in Eastern Massachusetts. This is a matter that is vital to the future of our company—as well as many other growing businesses in Eastern Massachusetts.

I write on behalf of MJ Research, Inc., which is a biotech manufacturing firm in Waltham. Our company employs about 250 people in a wide variety of disciplines, and we are a world leader in our area of DNA analysis technology. We have distributors in over forty nations, we have been two years an "Inc. 500" company, and we were recently honored with a "Business Excellence" award from the Greater Boston Chamber of Commerce. In short, I think we are the sort of business that Massachusetts wishes to develop (and keep).

PROBLEM FOR MASSACHUSETTS BUSINESS

A significant problem MJ Research frequently experiences is the slow (and exceedingly expensive) airline travel in and out of Boston. The biotech business requires that executives, scientists, service personnel, etc. frequently fly to other cities for one-day meetings or service calls, leaving in the morning and returning in the evening. But that is almost impossible to do in a reliable fashion from Logan Airport, because even on clear days, you will often find yourself sitting for two hours on the tarmac at Newark Airport, for example, waiting for a landing slot at Logan. This can be very imposing upon the time of the employees of MJ Research, diminishing our corporate efficiency and morale considerably. 132.1

PROBLEM REGARDING CONVENTION CENTER EXPANSION

This persistent "delay" problem is going to be exacerbated extraordinarily by the construction of a new convention center. We typically exhibit at 20+ conferences at such convention centers each year. Believe me, flying in an out of a convention city with 20,000 other attendees jams the airport in every convention city in the U.S. on the days that a major convention begins or ends (which typically composes three or four days in a week). Those individuals who advocate a vastly expanded convention business in Boston, while simultaneously opposing a runway expansion, are naïve at best. 132.2

NEED FOR NEW RUNWAY; SYPMPATHY FOR EAST BOSTON RESIDENTS

In the short term, I see no alternative but to open the proposed new runway at Logan Airport. It is the central airport of New England, and the fact is, the current runways are oversubscribed the instant a land breeze begins to blow towards Boston Harbor. We need a new runway at Logan, period.

But I am sympathetic to the concerns of the citizens of East Boston, Roxbury, Chelsea, Quincy and elsewhere, and I don't think these communities deserve to have every jet airplane flying in and out of Boston passing over their heads for the next fifty years. Rather, I wish to advocate in addition to the Logan expansion increased commercial service at Hanscom Field. But more importantly, I believe we should develop the old South Weymouth Naval Air Station as a new Boston airport.

INCREASED COMMERCIAL SERVICE AT HANSCOM FIELD

As our company is located on Route 128 in Waltham, increased commercial service at Hanscom Field would be exceedingly convenient for us (as well as everyone else on Routes 128 and 2 and along the Interstate 93 corridor). Hanscom has the advantages of having existing highway approaches from both Routes 2A, 4 and 225—which should give adequate capacity for a moderate expansion. In particular, if there were simply increased commercial service to the New York, Chicago, and Washington D.C. airports, a large fraction of the highly-profitable business traffic could be diverted to this airport, without imposing excessively on the local citizens or the highway infrastructure. These three cities represent major hubs both nationally and internationally, and it would be greatly helpful to have Hanscom as a viable airport alternative for the Route 128 and the Metrowest crowd.

132.3

FORMER SOUTH WEYMOUTH NAVAL AIR STATION

Perhaps the biggest unrealized opportunity for improving commercial air service in New England lies in the property that was once the South Weymouth Naval Air Station (NAS). This is an existing large airport, it has long runways capable of handling heavy jet traffic, and it has been used until quite recently for heavy military jet traffic (most of the approaches to the former NAS are over forest, highways or industrial buildings). Although the South Weymouth NAS Re-Use and Planning Committee has studied the matter for some time and has decided upon making the property into a shopping mall -- this old air base is potentially a resource of extraordinary value for ALL of New England. Thus I think its redevelopment should be more carefully considered, with the needs of the whole region in mind (and I hear the shopping mall plan is in trouble anyway).

The decisions being made today will affect all of New England for decades to come. It is inconceivable to me that more attention has not been given to the South Weymouth alternative, for this a unique opportunity to address fundamental problems with the New England infrastructure that are causing this ages-old Logan debate in the first place. The former NAS is well located on Routes 128 and Route 3, it would give good access to the South Shore and Cape Cod, and it is located along the new South Shore Commuter Rail Line. Furthermore, a short extension of the Red Line could easily bring MBTA subway service, which would conveniently connect a new airport to all of central Boston.

I have heard some argue that use of the old NAS as a commercial airport "interferes with Logan flight paths." As a licensed pilot of fifteen years experience, I simply don't understand this argument. The Navy's heavy use of this airport for decades didn't interfere—and military flight paths are typically considerable. Even if there were some limited interference—surely the flight paths of Logan could be adjusted to accommodate an airport a dozen miles away, if these same paths can be adjusted to accommodate a new Logan runway a quarter mile from existing runways.

Assembling property in the 1990's for a wholly new airport is a virtual impossibility—and the problem will only get worse in the twenty-first century. But in South Weymouth we have an existing large airport seemingly tailor-made for commercial use! A new Boston airport would provide long-term, high-quality local job opportunities for the residents of Weymouth, Rockland, Abington and Hingham (as well as the rest of the South Shore), while improving the air transportation opportunities for all of New England.

Thank you for taking the time to read my comments, and I look forward to your determination on the current proposal. It truly is a matter of significant concern for all of Massachusetts business.

Sincerely,

John Finney

Code	Topic 1	Topic 2	Comment	Response
132.1	Purpose and Need	Delay	[Air service at Logan is unreliable due to delay problems.]	Comment noted.
132.2	Purpose and Need	Delay	[Logan needs to be efficient if Boston is to attract significant convention business.]	Comment noted.
132.3	Regional Transportation	Regional Airports	I...advocate in addition to the Logan expansion increased commercial service at Hanscom Field. But more importantly, I believe we should develop the old South Weymouth Naval Air Station as a new Boston airport.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field, consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.

Nantucket Island Chamber of Commerce
48 Main Street • Nantucket, Massachusetts 02554-3595 . 508-228-1700 . FAX: 508-325-4925

April 7, 1999

LETTER 133

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
Cambridge Street
20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

As an advocate for the business community on Nantucket Island, the Nantucket Island Chamber of Commerce wishes to make a statement regarding the proposed unidirectional runway at Logan airport.

Nantucket is geographically isolated, and relies more than most communities on safe and efficient air travel. Nantucket Memorial Airport is in the summer months New England's second-busiest airport, and on certain summer days has actually exceeded volumes seen at Logan. Air travel is a linchpin of our tourism economy, and since over 25 percent of our incoming commercial flights are vectored through Boston, the timeliness with which Logan Airport operates has a direct impact on our island. In addition, year-round residents of Nantucket rely upon air access to Boston for business, medical, and recreation needs, all of which can be fouled by delays.

The Chamber of Commerce also considers the new runway a better investment of Massport's resources than any of the stated alternatives, particularly reintroduction of a peak-period landing fee program. These programs are misguided and discriminatory, and punish the small airlines who contribute least to Logan's myriad delays. Studies have clearly shown the effectiveness of peak-pricing in delay reduction to be questionable at best. Furthermore, should a peak pricing structure be installed in Boston, it would have the potential to cripple Cape Air, the independent airline that provides our major link to Logan Airport, and the loss of which would do irrevocable damage to our island's economy.

133.1

133.2

133.3

The Chamber recognizes local concerns about noise; noise abatement has been a major issue on Nantucket as well. However, if the proposed runway is unidirectional, and remains unidirectional in perpetuity, then the impact of air operations will be minimized by overwater takeoffs and landings. Thank you for your consideration.

Sincerely,

Maia Gaillard

LETTER 134

April 19, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

The Nantucket Planning and Economic Development Commission ("NP&EDC") appreciates this opportunity to comment on the Draft Environmental Impact Report on the Logan Airside Improvements Planning Project, dated February, 1999.

The NP&EDC is the regional planning agency for the Island, Town, and County of Nantucket. As an Island, Nantucket faces unique transportation challenges. Nantucket is dependent on water and air transportation as critical links to the mainland. Among the most important transportation service are the air links between Nantucket and Boston's Logan Airport. The most consistent and frequent of which is provided by small carriers.

Peak Period Pricing

The NP&EDC understands that congestion of existing runways at Logan Airport is a serious concern, and threatens to erode the efficiency and margin of safety of airport operations. Among the options proposed by the DEIR is use of peak period pricing to control the demand at certain times. The NP&EDC is adamantly opposed to this method to reduce congestion. This air corridor is time-sensitive to Nantucket residents and businesses. The inevitable consequence of peak period pricing on Nantucket travelers and businesses is the absorption of additional transportation costs. Although the popular conception of Nantucket is a wealthy resort destination, this is not the reality. Businesses on Nantucket, as in any other place, must strike a balance between profit and overhead. Residents now pay over 30% more for transportation than their mainland counterparts. On Nantucket, transportation costs are already a substantial cost of living and doing business and there are escalating costs of land, rents and infrastructure. For those businesses that are forced to absorb the delays that are a consequence of peak period pricing, these delays equate to added cost for Nantucketers as well. There are virtually no reasonable alternative options available. Should peak period pricing force businesses to

134.1

134.2

abandon air service to Boston, other modes, or combination of modes of transportation must be used which are inefficient, and time consuming. Islanders frequently require connections to Boston for medical, professional, personal, governmental and other reasons.

Unidirectional Runway 14/32

The NP&EDC believes that the proposed Unidirectional Runway 14/32 is the best solution for improving congestion at Logan. Based on the information provided in the DEIR, this runway isolates much of the small carrier traffic from major carrier traffic, and by reducing this conflict, decreases delays. The improvements add no apparent costs to air carrier services and transportation costs between Nantucket and Logan, which is of course of critical importance to Nantucket. 134.3

In conclusion, the NP&EDC appreciates this opportunity to comment on this issue of serious economic impact to Nantucket. Nantucket as a thriving, historically preserved community is a substantial contributor to the economic well being of the Commonwealth, and this fact should not be lost as you assess the impacts of these various alternatives.

Very truly yours,

Alvin S. Topham
Chairman

Code	Topic 1	Topic 2	Comment	Response
134.1	Alternatives	Peak Period Pricing	The NP&EDC is adamantly opposed to...[peak period pricing] to reduce congestion.	The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. See Section 4.5 of the Supplemental DEIS/FEIR.
134.2	Alternatives	Peak Period Pricing	[Implementation of peak period pricing at Logan would adversely affect Nantucket's economy.]	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
134.3	Alternatives	Runway 14/32	The NP&EDC believes that the proposed Unidirectional Runway 14/32 is the best solution for improving congestion at Logan. Based on the information provided in the DEIR, this runway isolates much of the small carrier traffic from major carrier traffic and by reducing this conflict, decreases delays. The improvements add no apparent costs to air carrier services and transportation costs between Nantucket and Logan, which is...of critical importance to Nantucket.	The benefits of Runway 14/32 are significant: (1) It provides a third runway for operations during northwest winds; (2) it reduces total annual delay by 27 to 37 percent (Preferred Alternative vs. the No Action Alternative); (3) it reduces delays during VFR conditions by 47 to 57 percent (Preferred Alternative vs. the No Action Alternative); (4) it allows controllers to separate aircraft of differing size classes during northwest winds; and (5) it increases the controllers' ability to achieve PRAS goals.

LETTER 135

Jay Wickersham, Director
MEPA
100 Cambridge Street
Boston, MA 02202

RE: LOGAN DELAY REDUCTION PROGRAM

Dear Mr. Wickersham:

NAIOP strongly supports Massport's Logan Delay Reduction Program in general and the cornerstone of this proposal, a new uni-directional runway. 135.1

Logan Airport is the 17th busiest airport in the nation, and the sixth worst in terms of delays. With growing demand for its services, Logan has not had any significant runway improvements in 25 years. A new runway for Logan Airport is vital for the state's continued economic growth. Without it, delays will get much worse; with it MassPort has predicted a 25% reduction in delays.

NAIOP and the research group, Mass Insight, have produced "The Massachusetts Expansion Report" the last four years, based on interviews with senior executives in the top growth sectors in the state. Over the last two years, access and reliability at Logan Airport were singled out as significant disadvantages to Massachusetts businesses. The companies that are growing in Massachusetts engage in a great deal of air travel by employees and clients (consulting, money management, high tech, telecommunications, etc.). The frequency with which Logan is closed due to weather relative to places like Chicago, Dallas, or Atlanta, was specifically cited. These business executives and their site location consultants say Logan Airport improvements are a top priority. 135.2

Although Massport's plans also include expansion of service at other regional airports, an expanded rail service to Rhode Island, and a new high-speed rail service with New York City; alone, they are not sufficient to resolve the long term flight delay problems.

By redirecting small and mid-size planes to the planned "14-32" uni-directional runway, pressure would be taken off of the other runways, especially during the potentially crippling conditions with a northwest

wind that presently causes Logan to limit runway usage and ground flights.

The Massachusetts Chapter of NAIOP (National Association of Industrial and Office Properties) represents the commercial real estate industry through its legislative affairs efforts, educational programs, and its continual research into critical issues of business development. NAIOP is the leading voice for commercial real estate in the state and represents the interests of companies involved with the development, ownership, management, and financing of commercial properties as well as those companies providing services to this industry. Our membership consists of over 350 members who own or manage more than 85 million square feet of office, research & development, and industrial space in the Commonwealth.

Sincerely,

NAIOP, MASSACHUSETTS

Re: Massachusetts Port Authority (MPA) Logan Airside Improvements Planning Project DEIS/DEIR – **EOEA No. 10458**
Boston-Logan International Airport

The National Association of Railroad Passengers, with 14,000 members nationwide, believes that the North Station-South Station Rail Link in Boston is the single most important rail passenger infrastructure investment opportunity in New England and one of the most important in the nation. For that reason, we gave our Golden Spike Award to Governor Weld and State Rep. John Businger, both of whom accepted the awards in person at our Washington reception in April, 1994. A year earlier, Senate Majority Leader George Mitchell came to accept the same award, in part for his role in securing $4 million for Amtrak for preliminary work on the Rail Link.

We are concerned that the above-captioned DEIS/DEIR does not reflect the importance of this opportunity.

1. **The Rail Link ridership diversion number shown in the Massport report is so low as to be completely lacking in credibility.** 136.1

I refer in particular to the claim that a North Station-South Station rail link would divert only 128 people a day from Logan to rail. ["The preliminary analysis conducted by project proponents indicates that the North-South Rail Link would increase 2020 intercity rail ridership on the Northeast Corridor primarily by diverting passengers from auto with only a small amount of diversion from air—approximately 46,700 passengers."]

- This figure [46,700 / 365 = 127.9] seems to completely discount improved connectivity between north-side commuter rail lines and high speed rail. In other words, it does not include people who are riding through the rail link tunnel on commuter rail but are doing so in order to connect with high speed rail at South Station.
- It clearly does not reflect operation of any trains between Maine and New York, which Amtrak certainly would run if the Rail Link existed. We understand that Amtrak is developing new numbers based on the assumption of some Portland-New York run-through service.
- It probably reflects a *very* conservative estimate of demand for the limited extensions of high-speed trains to Woburn cited.

2. **The report overstates the quality of existing New York-Washington service with respect to both frequency and speed.**

The result is to understate the ability of rail to attract ridership and market-share. In other words, existing New York-Washington market-share (about 40% of air-rail traffic, much higher if intermediate markets are included), has been achieved with fewer and slower trains than the report shows. The report therefore is misleading because it gives the reader a more pessimistic picture than the facts support regarding the amount of ridership that a given service level can attract.

The report states that "regular [non-Metroliner] trains generally take about 3 hours and 30 minutes with as many as 20 additional trains departing on weekdays in both directions." In fact, there are only 17 trips in each direction. Five of the southbound trains take between 3:35 and 3:50, a sixth takes 4:34; nine [over half!] of the northbound trains take 3:35-55.

The report states that Metroliners take "about 2:50". In fact, the fastest published time is 2:58, and is achieved by just one train (5:25 am from New York). Most trips are 2:59, a few are 3:05. [The standard weekend Metroliner running time is 3:04.]

The report states that New York-Washington trains "travel at an average speed of 100 mph." This is obviously untrue, since—as just noted—the fastest train scheduled takes 2:58, and so averages 76 mph on the 226-mile run. The *top* Metroliner speed is 125 mph. When intermediate stops and slow approaches (especially Baltimore and Philadelphia) are taken into account, a 100-mph average obviously is not possible.

[The report implies that there is more freight east of New York than west, but this also is not true. Indeed, Amtrak's freight revenues (payments by railroads running freight trains in the corridor) have been rising recently.]

3. **Similarly, by overstating existing New York-Boston frequencies and (presumably) accurately stating planned service, the report understates the degree to which the service will be improved.**

The report says there are ten Boston-New York trains a day in each direction, running times ranging from 4:10-5:00, but there are only eight realistic eastbound choices, nine westbound (including the *Twilight Shoreliner* that departs New York at 1 AM eastbound and arrives New York at 1:14 AM westbound).

The 9th and 10th eastbound trains and the 10th westbound are on the Inland Route; running-time: six hours.

- Most travelers will not take seriously the 3:55 PM Inland Route train from New York, which reaches Boston 28 minutes *after* the 4:55 from New York.
- Or the 9:40 PM from New York that arrives Boston at 3:40 AM.
- Or the 7:55 AM from Boston which reaches New York 50 minutes *after* the 8:25 AM from Boston.

In short, we believe that an accurate analysis would show that the Rail Link has far greater relevance to Boston airport requirements than is reflected in this DEIS/DEIR or the documents on which it relies. We believe this reflects a significant planning deficiency in the DEIS/DEIR and urge that these be addressed in a new Draft.

Thank you for considering our views.

Sincerely,

Ross B. Capon

136.1	Regional Transportation	Passenger Rail	The Rail Link ridership diversion number shown in the Massport report is so low as to be completely lacking in credibility.	The rail estimates are from existing, independent rail planning documents that examined total inter-city travel demand regardless of mode of travel and then predicted mode shifts that would result from implementing the rail project. Hence the rail estimates do not differ for the 37.5M and 45M Logan Airport passenger scenarios.

Attention: Mr. Arthur Pugsley
MEPA #10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

Reference: EOEA #10458 Logan Airside Improvements

Dear Mr. Pugsley:

The undersigned state directors represent the following agencies that have responsibility for oversight of aeronautical activities within their respective states:

Connecticut Department of Transportation, Bureau of Aviation and Ports
Maine Department of Transportation, Office of Passenger Transportation
Massachusetts Aeronautics Commission (MAC)
New Hampshire Department of Transportation, Division of Aeronautics
Rhode Island Airport Corporation
Vermont Agency of Transportation, Division of Rail, Air, and Public Transportation

137.1

Please accept this letter as an expression of our strong support for the airside improvements and our firm opposition to the imposition of peak period pricing at Logan International Airport.

Contrary to published reports in the media, considerable planning has been done on a multi-state level to improve air service throughout New England. We have been working with the Federal Aviation Administration (FAA), the Massachusetts Port Authority (Massport), the New England Council and nine regional airports since 1994 to improve air service throughout New England. Those regional airports are:

Connecticut: Bradley International Airport and Tweed New Haven Airport
Maine: Bangor International Airport and Portland International Jetport
Massachusetts Aeronautics Commission: New Bedford Regional Airport and Worcester Regional Airport
New Hampshire: Manchester Airport

Rhode Island: T. F. Green Airport
Vermont: Burlington International Airport

In 1990, the MAC initiated a siting study commonly referred to as the Second Major Airport Study ("SMAS") to determine whether there were any suitable sites for a second major airport in Massachusetts. The SMAS started with 182 sites and eventually recommended further consideration of 2 sites at Fort Devens and in the Gardner/Winchendon area. In 1992, the MAC announced it would reevaluate air transportation demand and capacity in the context of a multi-modal, high speed transportation system and initiated a second study commonly referred to as the Strategic Assessment Report ("SAR") study. In November 1993, the final SAR report reconfirmed that the demand for air service at Logan will surpass capacity. More importantly, however, the SAR also identified several scenarios that, if implemented, could preclude the necessity for construction of a second major airport to meet that excess demand. Those scenarios include improved air service at regional airports, improved rail service, improved telecommunications technology, and airside improvements at Logan. The logic behind pursuit of these alternative solutions should be obvious given the staggering financial, environmental and social costs to construct a second major airport. Our mutual planning efforts were a natural progression from the SMAS and SAR and complement the analysis of surface transportation issues performed under the New England Transportation Initiative (NETI).

To date, we have:

- Identified existing air service levels at each regional airport.
- Estimated the degree of leakage; leakage was defined as the number of passengers in a regional airport's marketing area that used either Logan or the three New York City (NYC) Airports (LaGuardia, John F. Kennedy, and Newark).
- Analyzed potential for improved or new air service at the regional airports in New England.
- Conducted a Regional Airports Route Development Conference where representatives of the regional airports met with representatives of more than a dozen major, regional and Canadian air carriers (Air Nova, Air Ontario, American Eagle, Business Express, Cape Air, Commutair, Eastwind, Kiwi International, Northwest, Southwest, Trans World Airlines, USAir, and USAir Express).
- Assessed the potential impacts that improved air service at regional airports would have on air service at Logan.
- Designed a regional airport fare sampling methodology.
- Analyzed the results of a common fare pricing strategy at a regional airport.

In 1998, approximately 40% of the domestic destination passengers departing those regional airports and Logan departed from the regional airports, up from 35% in 1996. In that two year period, the total number of domestic enplanements at all ten airports rose by 13.4%; however, domestic

enplanements at the nine regional airports increased by more than 31% while Logan's domestic enplanements only increased by approximately 4%. Clearly, the combined efforts of the six state aviation agencies, the nine regional airports, the FAA and Massport are diverting demand away from Logan and to the regional airports. Each year, as the state directors and regional airports work with the FAA to update their respective Capital Improvement Plans, we consider both the local and the regional impacts of those proposed capital improvements. The new airport terminals, runway extensions, and other improvements at Bradley, Manchester, New Bedford, T.F. Green and Worcester are all complementary of our individual and joint efforts to improve regional air service throughout New England and they all contribute to reducing delays at Logan. 137.2

We urge you to approve the airside improvements proposed by Massport. Those improvements are necessary to ensure a safe and efficient New England airport system to serve scheduled passengers. Similarly, we object to any efforts to artificially constrain demand through the employment of peak period pricing. Notwithstanding the success of the regional airports, our communities will continue to utilize Logan for markets not served by the regional airports. 137.3 137.4

Notwithstanding the success of the regional airports, our communities will continue to utilize Logan for markets not served by the regional airports.	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

Reference: EOEA #10458 Logan Airside Improvements

Dear Mr. Pugsley:

Reference is made to the letter dated April 12, 1999 to you regarding the subject Environmental Impact Statement/Report EOEA #10458.

This is to confirm that the National Association of State Aviation Officials has reviewed said letter and endorses the recommendations and findings contained therein. We urge you to approve the airside improvements proposed by Massport and we object to any efforts to artificially constrain demand through the employment of peak period pricing. 138.1

Sincerely,

William E. Gehman
Chairman

138.1	Alternatives	Preferred Alternative	We urge you to approve the airside improvements proposed by Massport and we object to any efforts to artificially constrain demand through the employment of peak period pricing.	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

NEIGHBORHOOD ASSOCIATION OF THE BACK BAY, INC.

April 23, 1999

LETTER 139

Mr. Arthur Pugsley
Executive Office of Environmental Affairs
MEPA Unit
EOEA #14508
100 Cambridge Street
Boston, Massachusetts 02202

Dear Mr. Pugsley:

The Neighborhood Association of the Back Back is writing to request that MEPA reject the draft Environmental Impact Report (EIR) submitted by the Massachusetts Port Authority (Massport) relative to the proposed Runway 14/32. We firmly believe that the EIR insufficiently addressed environmental impacts of Runway 14/32. Specifically, the EIR fails to adequately address (1) landside environmental impacts and (2) the necessity to regionalize airline traffic. In addition, the EIR utilizes inconclusive data relative to delays at Logan International Airport (Logan).

Landside Impacts

The EIR fails to address landside impacts of the proposed Runway 14/32. Massport has stated that the new runway will increase the number of annual passengers from the current 26 million to more than 37 million by 2010. These increases in passengers and airline traffic will have dramatic impacts on residents in and around Boston. 139.1

The added capacity and the resulting increased use of Runways 9/27 and 15/33 will inflict heavy noise impacts on Boston neighborhoods including East Boston, Charlestown, South Boston, Beacon Hill, Roxbury, Jamaica Plain and the Back Bay, and potentially areas such as Hyde Park, Roslindale and West Roxbury. In addition, the impacts on the streets and neighborhoods of Boston will be substantial. Such impacts include additional traffic caused by the increase in cars, trucks and shuttle buses serving the increase in passengers at Logan. 139.2 139.3

MEPA should reject the draft EIR because substantial landside impacts such as noise, traffic, productivity and general quality of life for Boston's neighborhoods have not been adequately addressed. 139.4

Lack of Regional Planning

The EIR fails to adequately address the necessity to regionalize airline traffic or to plan for another major airport. The EIR demonstrates that there has been no real planning by 139.5 139.6

Massport to promote the use of the region's other major airports in Massachusetts, New Hampshire and Rhode Island. In fact, growth at Green and Manchester airports has not been the result of planning, but from market forces related to cheaper airfares and easier traffic and commuter access. The EIR fails to address important issues such as planning for the provision of rail service to Green Airport, diversions to Manchester and Worcester airports and the effect of high speed rail service in the eastern corridor, among others.

In addition, even if Runway 14/32 is approved and built, Logan will soon reach its new capacity and Massport will seek additional runways to handle more airline traffic. Massport and the state should conduct a study of a second major airport that may serve the region in the next decade. Such a study in the 1980s included a potential site at the decommissioned Fort Devens. The study's recommendations, however, were never acted upon. Certainly, the EIR continues this failure to address the real need for a second major airport in the region. 139.7 139.8

MEPA should require that the EIR adequately address the regionalization of airline traffic and the need for a second major airport.

Inconclusive Data

The data upon which Massport has relied in preparing the EIR is inconclusive at best. There are significant discrepancies in the EIR relative to the rate of delay at Logan used by Massport and those of the FAA and others, calling the reliability of the entire EIR into question. 139.9

The EIR also fails to adequately discuss factual data regarding delays and the actual causes of those delays. First, use of 1993 as a base year is deceiving. In 1993 Logan had a year of severe delays that has not been matched since. In fact, currently less than four percent of flights are delayed at Logan. Second, the EIR fails to address what portion of the delays were caused by wind and weather that would have closed runways or the entire airport regardless of the existence of Runway 14/32. 139.10 139.11

MEPA should require Massport to withdraw its EIR until it can confirm this critical delay data.

For all of the above reasons, we respectfully request that MEPA reject the draft EIR submitted by Massport relative to Runway 14/32.

Sincerely,
NEIGHBORHOOD ASSOCIATION OF THE BACK BAY

Peter Y. Flynn
Vice Chairman

Peter Sherin

Code	Topic 1	Topic 2	Comment	Response
139.1	Cumulative Impacts	Landside Improvements	The EIR fails to address landside impacts of the proposed Runway 14/32.	The proposed improvements analyzed in the Supplemental DEIS/FEIR involve both construction and administrative actions that will facilitate aircraft operations (landings, takeoffs and taxiing). None of the improvements involve landside facility improvements (*e.g.*, terminals and roadways) or related operations. The Supplemental DEIS/FEIR analyzes in detail the impacts from aircraft operations, including analysis of noise and air quality impacts during the years 1993, 1998 and under future forecast scenarios as well as environmental benefits from certain of the improvement concepts under review. In this respect, the Supplemental DEIS/FEIR conforms with scoping directives from the lead federal agency (the FAA) and with applicable FAA environmental orders, all issued in accordance with NEPA, and with directives from EOEA issued under MEPA. The various GEIR documents, including the *Logan Airport 1998 Annual Update* and the *1999 Environmental Status and Progress Report* (previously GEIR), provide additional analytic context by examining cumulative impacts from airside (*i.e.*, aircraft) operations and landside (*e.g.*, vehicular traffic, terminal service vehicles) operations at Logan Airport as well as Massport's comprehensive mitigation program. The ESPR/GEIR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR as a background document. Each GEIR/ESPR submission is subject to public review and comment. The *Logan Airport 1998 Annual Update* and the *1999 ESPR* analysis is based on the same forecast levels used in the Supplemental DEIS/FEIR. The GEIR/ESPR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Supplemental DEIS/FEIR. Consistent with past practice, Massport expects that the FAA will take the GEIR/ESPR analysis into account during its deliberations and ultimate decision on the Supplemental DEIS/FEIR.
139.2	Noise	Impacts	The added capacity and the resulting increased use of Runways 9/27 and 15/33 will inflict heavy noise impacts on Boston neighborhoods....	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
139.3	Ground Transportation	Traffic	[The proposed project will result in increased traffic in Boston.]	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
139.4	Environmental Review Process	MEPA	MEPA should reject the draft EIR because substantial landside impacts such as noise, traffic, productivity and general quality of life for Boston's neighborhoods have not been adequately addressed.	Refer to response to Comment 139.1.
139.5	Environmental Review Process	MEPA	The EIR fails to adequately address the necessity to...plan for another major airport.	Comment noted.
139.6	Regional Transportation	Regional Airports	...there has been no real planning by Massport to promote the use of the region's other major airports in Massachusetts, New Hampshire and Rhode Island.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
139.7	Alternatives	Runway 14/32	...even if Runway 14/32 is approved and built, Logan will soon reach its new capacity and Massport will seek additional runways to handle more airline traffic.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport.
139.8	Environmental Review Process	MEPA/NEPA	Massport and the state should conduct a study of a second major airport that may serve the region in the next decade.	Comment noted.
139.9	Delay	Model	There are significant discrepancies in the EIR relative to the rate of delay at Logan used by Massport and those of the FAA and others, calling the reliability of the entire EIR into question.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
139.10	Analysis Assumptions/ Methodologies	Base Year	...use of 1993 as a base year is deceiving.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
139.11	Delay	Model	...the EIR fails to address what portion of the delays were caused by wind and weather that would have closed runways or the entire airport regardless of the existence of Runway 14/32.	The delay reductions presented in Chapter 4 of the Supplemental DEIS/FEIR are the result of the Airside Project alternatives. The remaining delays are largely due to wind and weather conditions that are not helped by Runway 14/32.

THE
NEW ENGLAND
COUNCIL

TESTIMONY OF JAMES T. BRETT
PRESIDENT & CEO
THE NEW ENGLAND COUNCIL
April 21, 1999

LETTER 140

MY NAME IS JAMES T. BRETT AND I AM THE PRESIDENT AND CEO OF THE NEW ENGLAND COUNCIL, A REGION-WIDE BUSINESS GROUP THAT PROMOTES POLICIES TO STIMULATE ECONOMIC GROWTH THROUGHOUT OUR SIX STATE NEW ENGLAND REGION. THANK YOU FOR THE OPPORTUNITY TO PRESENT COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT AND DRAFT ENVIRONMENTAL IMPACT REPORT ON THE LOGAN AIRSIDE IMPROVEMENTS PLANNING PROJECT.

TEN YEARS AGO, THE NEW ENGLAND COUNCIL JOINED AN ELUSIVE, AND ULTIMATELY FUTILE SEARCH FOR A SITE FOR A SECOND MAJOR AIRPORT FOR NEW ENGLAND. WE WERE MOTIVATED BY TWO FACTORS: THE INCREASING IMPORTANCE OF AIR TRAVEL FOR OUR REGION'S BUSINESSES AND FUTURE ECONOMIC GROWTH, AND THE LIKELY INABILITY OF THE REGION'S DOMINANT AIRPORT, BOSTON'S LOGAN INTERNATIONAL AIRPORT, TO ACCOMMODATE EVEN CONSERVATIVE ESTIMATES OF INCREASE IN DEMAND.

IN 1993, THE COUNCIL HELPED ESTABLISH A COALITION THAT GREW TO INCLUDE THE SIX STATE AVIATION DIRECTORS FROM NEW ENGLAND, MASSPORT, THE MANAGERS OF THE MAJOR JET SERVICE AIRPORTS IN THE REGION, AND THE FEDERAL AVIATION ADMINISTRATION. OUR SHARED GOAL WAS THE GREATER UTILIZATION OF THE REGIONAL AIRPORTS, BOTH AS A MEANS OF STIMULATING ECONOMIC ACTIVITY IN THE AREAS CLOSEST TO THOSE AIRPORTS AND TO RELIEVE THE OVERWHELMING BURDEN ON LOGAN AIRPORT. A TWO-YEAR STUDY YIELDED SOME FASCINATING INFORMATION AND HELPED POINT THE WAY FOR ACHIEVING THESE GOALS.

WE FOUND:

- MORE THAN 5 MILLION OF LOGAN'S PASSENGERS—ABOUT 25% OF LOGAN'S TOTAL TRAFFIC—LIVE CLOSER TO ONE OR MORE OF NEW ENGLAND'S REGIONAL AIRPORTS;

- NONE OF THE REGIONAL AIRPORTS IS FULLY ACHIEVING THEIR TRAFFIC POTENTIAL;

- WITH REASONABLE IMPROVEMENTS IN SERVICE LEVELS AND COMPETITIVE FARES, OUR STUDY FOUND THAT THE REGIONAL AIRPORTS COULD "RECAPTURE" 50% OF THE PASSENGERS IN THEIR MARKETS.

NOW, SOME TEN YEARS AFTER OUR UNSUCCESSFUL ATTEMPT TO SITE A SECOND AIRPORT IN THE REGION, AND WITHOUT MOVING AN OUNCE OF DIRT, NEW ENGLAND HAS ITS SECOND AIRPORT—IT'S JUST NOT ALL IN ONE LOCATION OR EVEN ONE STATE!

T.F. GREEN AIRPORT IN RHODE ISLAND HAS INCREASED ITS PASSENGER BASE FROM 2.5 MILLION IN 1996 TO 4.6 MILLION LAST YEAR, MAKING IT THE SECOND FASTEST GROWING AIRPORT IN THE NATION. MANCHESTER, NEW HAMPSHIRE'S AIRPORT HAS DOUBLED ITS PASSENGER LOAD FROM 1 MILLION IN 1996 TO 2 MILLION LAST YEAR. AND WITH MASSPORT ENGAGED IN NEGOTIATIONS TO TAKE OVER THE DAY TO DAY OPERATIONS AT WORCESTER AIRPORT—AN AIRPORT THAT ONLY A DECADE AGO WAS SERVICING NEARLY 400,000 PASSENGERS A YEAR, BUT THAT NOW IS STAGGERING—AND COMMITTED TO BRINGING COMMERCIAL, CARGO, AND CHARTER FLIGHTS BACK TO CENTRAL MASSACHUSETTS, THE POTENTIAL EXISTS TO ACCOMMODATE THE 1.7 MILLION PASSENGERS WHO LIVE CLOSEST TO THAT FACILITY. COLLECTIVELY, THESE FACILITIES ARE, IN FACT, NEW ENGLAND'S SECOND AIRPORT.

THESE ACTIONS WILL CERTAINLY HELP RELIEVE A BURDEN ON LOGAN, AN AIRPORT THAT CONSISTENTLY RANKS AMONG THE NATION'S LEADERS IN DELAYS—AND THE ECONOMIC COSTS ASSOCIATED WITH THOSE DELAYS. BUT MORE NEEDS TO BE DONE. THAT'S WHY THE RECENT ANNOUNCEMENT BY AMTRAK THAT THEY WILL BEGIN HIGH SPEED RAIL SERVICE BETWEEN BOSTON AND NEW YORK CITY THIS FALL, REDUCING THE TRAVEL TIME BETWEEN THOSE CITIES TO THREE HOURS, IS SUCH WELCOME NEWS. AND WHY MASSPORT'S PLANS TO CONSTRUCT A NEW UNIDIRECTIONAL RUNWAY THAT WILL ONLY OPERATE OVER WATER, HAS BEEN HERALDED BY LEADERS OF BUSINESS AND GOVERNMENT.

THE ABILITY TO TRAVEL TO MIDTOWN MANHATTAN IN THREE HOURS WILL ATTRACT A SIGNIFICANT NUMBER OF PASSENGERS NOW FLYING TO NEW YORK'S LAGUARDIA AIRPORT ON LONG ISLAND AND TAKING CABS INTO MANHATTAN. THIS WILL RESULT IN A REDUCTION OF LANDSIDE CONGESTION THAT OFTEN MAKES LOGAN SO DIFFICULT TO NAVIGATE. FEWER CARS ENTERING LOGAN ALSO MEAN CLEANER AIR.

THE CONSTRUCTION OF A NEW RUNWAY, DESIGNATED 14/32, SIMILARLY WILL DIRECTLY ADDRESS THE PROBLEM OF DELAYS WHICH DISPROPORTIONATELY AFFECTS THIS AIRPORT AND THE PEOPLE WHO USE IT. IN 1998, LOGAN EXPERIENCED OVER 143,000 HOURS OF DELAYS, FIVE TIMES THE FAA THRESHOLD FOR CONGESTION. ACCORDING TO MASSPORT, DELAYS AT LOGAN COST AIRLINES AND THEIR PASSENGERS APPROXIMATELY $310 MILLION LAST YEAR. IF NO ACTION IS TAKEN, IT IS ESTIMATED THAT BY 2010 THERE WILL BE 596,000 HOURS OF DELAYS. TO PUT THIS IN MORE PERSONAL TERMS, PASSENGERS COULD EXPECT AN AVERAGE DELAY OF 54 MINUTES EVERY TIME THEY FLY IN OR OUT OF LOGAN AIRPORT.

MOST DELAYS ARE CAUSED BY WIND AND WEATHER CONDITIONS AT LOGAN. A STRONG NORTHWEST WIND CAN REDUCE THE NUMBER OF OPERATIONAL RUNWAYS FROM THREE TO TWO OR EVEN ONE. UNDER NORMAL WEATHER CONDITIONS, LOGAN CAN ACCOMMODATE 120 OPERATIONS PER HOUR; WITH TWO RUNWAYS, LOGAN'S OPERATIONS DROP TO 90 PER HOUR AND WITH ONE RUNWAY, LOGAN'S OPERATIONS PLUNGE TO 60 PER HOUR.
RUNWAY 14/32 WOULD REDUCE ANNUAL DELAYS AT LOGAN BY 21% AND VIRTUALLY ELIMINATE ANY DELAYS RESULTING FROM NORTHWEST WIND CONDITIONS.

AS A RESULT, CURRENT AND PROJECTED FLIGHT ACTIVITY AT LOGAN DOES NOT EXCEED THE CAPACITY OF THE FACILITY. THAT'S WHY THE NOTION OF "PEAK HOUR PRICING" IS NOT A REASONABLE ALTERNATIVE—AND PERHAPS WHY NO AIRPORT IN THE NATION UTILIZES THAT PRICING SYSTEM. PEAK HOUR PRICING WOULD SIMPLY REDUCE THE NUMBER OF AIRCRAFT USING LOGAN BY MAKING IT UNECONOMICAL TO DO SO—AND CAUSE ENORMOUS HARM TO THOSE FROM OTHER NEW ENGLAND STATES WHO HAVE NO CHOICE BUT TO USE LOGAN AS THE CONNECTING AIRPORT FOR THEIR ULTIMATE DESTINATION. WE HAVE STUDIED THIS ISSUE AND DETERMINED THAT IT ADDRESSES A PROBLEM THAT LOGAN IS NOT EXPERIENCING. 140.1

MASSPORT HAS MADE AN IMPORTANT COMMITMENT TO USE THE NEW RUNWAY FOR ONLY OVER WATER TAKE-OFFS AND LANDINGS. AS A RESULT, 75,000 OPERATIONS—FULLY 15% OF TOTAL AIRPORT OPERATIONS—WOULD SHIFT FROM PATHS OVER COMMUNITIES TO FLIGHT PATHS OVER WATER. THOSE COMMUNITIES CURRENTLY EXPERIENCING THE MOST SEVERE NOISE IMPACT WOULD SEE SIGNIFICANT BENEFITS. IT IS TRUE THAT SOME COMMUNITIES WOULD SEE A SLIGHT INCREASE IN NOISE; MASSPORT HAS COMMITTED TO PROVIDING SOUNDPROOFING FOR THESE COMMUNITIES.

NEW ENGLAND IS FAST DEVELOPING A REGIONAL TRANSPORTATION SYSTEM CAPABLE OF SERVING THE NEEDS OF A GROWING ECONOMY-- A SYSTEM THAT WILL SOON INCLUDE HIGH SPEED RAIL TO NEW YORK CITY, A THRIVING GROUP OF REGIONAL AIRPORTS THROUGHOUT NEW ENGLAND, IMPROVED ACCESS TO THOSE AIRPORTS AND STEPS TO ENHANCE THE EFFICIENCY AND EFFECTIVENESS OF LOGAN AIRPORT. TOGETHER, THESE ACTIONS ARE ALLOWING NEW ENGLANDERS TO APPROACH THE 21ST CENTURY WITH BOTH OPTIMISM AND PRIDE THAT WE HAVE LEADERS WITH VISION AND COURAGE CHARTING THE COURSE FOR SUSTAINED ECONOMIC GROWTH. THEY DESERVE OUR FULL SUPPORT. 140.2

THANK YOU FOR THE OPPORTUNITY TO CONTRIBUTE MY VIEWS ON THIS IMPORTANT ISSUE.

Letter 140
New England Council
James T. Brett, President and CEO

Code	Topic 1	Topic 2	Comment	Response
140.1	Alternatives	Peak Period Pricing	Peak period pricing would simply reduce the number of aircraft using Logan by making it uneconomical to do so—and cause enormous harm to those from other New England states who have no choice but to use Logan as the connecting airport for their ultimate destination.	Refer to Section 4.5 of the Supplemental DEIS/FEIR for an expanded discussion of PPP. An exemption program designed to protect services to small communities most reliant on Boston for access to the national air transport system is described in Section 4.5.3 of the Supplemental DEIS/FEIR. The section provides an illustrative exemption program and its impact on the delay reduction potential of PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
140.2	Alternatives	Preferred Alternatives	...[The proposed project] deserve[s] our full support.	Comment noted.

Attention: Mr. Arthur Pugsley
Re: EOEA #10458
13 pages including this one

Attached is a copy of a copy of my testimony at your FAA/MEPA hearing on April 7, 1999.

Also attached is my testimony to the Joint Transportation Committee in regard to House Bills No/ 1676 and 1678 on March 23, 1999.

I'd like to add that flying to Logan from Hyannis in a Cape Air Cessna 402 to attend your April 7 hearing was a perfect example of what 14/32 could do to alleviate delays at Logan. We were approaching Logan about 5:00 p.m. and were advised that there would be approximately a 30 minute delay for runway 33L. If we could use 33R there would be no delay. We used 33R, straight in over the water.

Also attached are two opinion pieces from the Cape Cod Journal, "Massport Quiz," from the March 17, 1999 issue and "Time to Squeak," from the April 11, 1999 issue. I would like to add them as comments.

Thank you

Fran Gibson

Testimony at FAA/MEPA hearing, April 7, 1999

My name is Frank Gibson. I live in Cummaquid, on Cape Cod, an area which depends upon air service to and from Boston.

I am a strong believer in the need to complete Runway 14/32 and the centerfield taxiway.

Back when a former Massport board proposed PACE -- its Program for Airport Capacity Efficiency -- I organized a grass roots citizens group called **N.E.E.D. Logan** -- New England's Economy Depends on **Logan** -- to oppose PACE, a program extremely detrimental to the airlines serving Cape Cod and the islands.

Thankfully, the FAA determined that PACE was ill advised and it was stopped. With regard to the current talk about peak period pricing and slots, there is no question that financial deterrents to limit access to Logan are not the answer to delays at Logan caused by weather. Do not be fooled by the comments made by Massport's then-executive director Dave Davis that PACE was effective in reducing delays. Delays were reduced at Logan during the period PACE was in effect but the record will show that during that same time period similar reductions in delays were experienced at all major airports monitored by the FAA. The reason for these reductions across the board was quite simple. The airlines adjusted their schedules by adding minutes to their scheduled flight times. This meant more flights arrived on time, or even ahead of schedule. Since none of the other airports were using financial deterrents such as PACE, it is obvious that the schedule changes, not financial deterrents, were responsible for the reduction in delays.

141.1

The important factor for any airport is its physical capacity to handle all the flights

-more-

scheduled by its users to arrive and depart as scheduled. And, as I understand it, when all of Logan's runways are available for safe use, Logan has the capacity to handle all the traffic scheduled by the airlines using it.

Using all its current runways, Logan can handle 120 operations per hour. However, when there are strong winds from the northwest, Logan is limited to one runway, 15/33, and operations are reduced to 60 per hour. Runway 14/33 is not meant to increase the number of aircraft using Logan. It is simply to allow the aircraft currently using Logan to arrive and depart with out delays. 141.2

The completion of runway 14/32 for use in strong northwest wind conditions would give Logan much needed relief during the times when it is currently limited to operations on 15/33.

The completion of 14/32 would also enhance utilization of Logan at all times. By eliminating the need for the smaller aircraft that represent almost half of Logan's operations to have a six-mile separation behind large aircraft, Logan's operational efficiency to handle both large and small aircraft is increased.

Since aircraft arrivals and departures on 14/32 would be over water aircraft noise would be negligible. For those skeptical of this statement, I invite you to visit Barnstable Municipal Airport Standing in the Airport Plaza parking lot, directly across Route 28 from the end of runway 24, you can see the airplanes approach and land as if you were standing in front of the Harborside Hotel. I say you can *see* them. Note that I did not say you can *hear* them, because you can't hear them over the normal ambient noise of Hyannis. Using 14/32 the airplanes would be like polite children -- seen but not heard.

-more-

New England's Economy Depends on Logan. Logan's future depends on 14/32.
I ask that those who oppose 14/32 listen to the facts rather than react emotionally to misrepresentations of the facts.
They would discover that 14/32 is a win-win proposition for everyone.

Testimony at Joint Transportation Committee hearing, 3-23-99

My name is Frank Gibson. I live in Cummaquid, on Cape Cod, an area which depends upon air service to and from Boston.

I am a strong believer in the need to complete Runway 14/32 and the centerfield taxiway. I am here to oppose House Bills No. 1676 and 1678.
Back when a former Massport board proposed PACE -- its Program for Airport Capacity Efficiency -- I organized a grass roots citizens group called **N.E.E.D. Logan** -- New England's Economy Depends on **Logan** -- to oppose PACE, a program extremely detrimental to the airlines serving Cape Cod and the islands.

Thankfully, the FAA determined that PACE was ill advised and it was stopped. With regard to the current talk about peak period pricing and slots (House Bill 1679), there is no question that financial deterrents to limit access to Logan are not the answer to delays at Logan caused by weather. Do not be fooled by the comments made by Massport's then-executive director Dave Davis that PACE was effective in reducing delays. Delays were reduced at Logan during the period PACE was in effect but the record will show that during that same time period similar reductions in delays were experienced at all major airports monitored by the FAA. The reason for these reductions across the board was quite simple. The airlines adjusted their schedules by adding minutes to their scheduled flight times. This meant more flights arrived on time, or even ahead of schedule. Since none of the other airports were using financial deterrents such as PACE, it is obvious that the schedule changes, not financial deterrents, were responsible for the reduction in delays.

-more-

The important factor for any airport is its physical capacity to handle all the flights scheduled by its users to arrive and depart as scheduled. And, as I understand it, when all of Logan's runways are available for safe use, Logan has the capacity to handle all the traffic scheduled by the airlines using it.

Using all its current runways, Logan can handle 120 operations per hour. However, when there are strong winds from the northwest, Logan is limited to one runway, 15/33, and operations are reduced to 60 per hour. Runway 14/33 is not meant to increase the number of aircraft using Logan. It is simply to allow the aircraft currently using Logan to arrive and depart with out delays.

The completion of runway 14/32 for use in strong northwest wind conditions would give Logan much needed relief during the times when it is currently limited to operations on 15/33.

The completion of 14/32 would also enhance utilization of Logan at all times. By eliminating the need for the smaller aircraft – that represent almost half of Logan's operations -- to have a six-mile separation behind large aircraft, Logan's operational efficiency to handle both large and small aircraft is increased.

Since aircraft arrivals on 14/32 would be approaching over water aircraft noise would be negligible. For those skeptical of this statement, I invite you to visit Barnstable Municipal Airport.

Standing in the Airport Plaza parking lot, which is directly across Route 28 from the end of runway 24, you can see the airplanes approach and land as if you were standing in front of the Harborside Hotel. I say you can *see* them. Note that I did not say you can *hear* them, because you can't hear them over the ambient noise of the Hyannis streets. Using 14/32 the airplanes would be like polite children – seen but not heard.

New England's Economy Depends on Logan.

Logan's future depends on 14/32.

I ask that those who oppose 14/32 listen to the facts rather than react emotionally to misrepresentations of the facts.

They would discover that 14/32 is a win-win proposition for everyone.

Massport Quiz

THE ISSUE

Fact: Airplanes take-off and land into the wind.

Fact: Boston's Logan International Airport has four runways. Two parallel runways are aligned in a northeast/southwest direction, one is aligned east/west and one is aligned northwest/southeast.

Fact: Under normal circumstances Logan can handle 120 aircraft operations (take-offs and landings) per hour, enough capacity to handle the schedules of all the airlines utilizing Logan.

Fact: When there are very strong winds from the northwest, crosswinds make three of the four runways unfit for safe operations. This reduces the capacity of the airport to 60 operations per hour and causes delays.

Fact: Massport proposes to build a second runway aligned in a northwest/southeast direction to increase Logan's capacity when strong winds blow from the northwest.

Question 1: Does this seem like a logical idea?

Fact: The landing approach to the proposed second northwest runway would bring aircraft in over the water, avoiding residential areas.

Question 2: Does this seem like a logical idea?

Unfortunate Fact: There are people who do not want the second runway built. Their answer to the delays caused by winds that limit Logan to one runway is to charge landing fees that would limit access to the airport, their idea being that if Logan's capacity becomes weather-restricted to 60 aircraft per hour instead of its normal 120, 60 aircraft will be priced out of landing.

Question 3: Does this seem like a logical idea?

Misconception: The people who do not want the second runway say that having another runway will increase the traffic at Logan.

Fact: Massport points out that the second runway would simply allow the planes currently scheduled to operate at Logan to do so with a minimum of delays.

Question 4: Does Massport's explanation sound logical?

We ask these questions because to us the answers to questions 1, 2 and 4 are obviously yes and the answer to question 3 is just as obviously no. The problem is that there are a lot of people in the Logan neighborhoods whose answers are just the opposite and they have been successfully fighting construction of the runway for 25 years.

Why? Because they don't trust Massport.

Here is what Massport has to say about the situation at Logan:

> *In 1998, Logan experienced over 120,000 hours of delay, compared to the 20,000 hours of delay that is the annual congestion threshold established by the FAA. Delays at Logan are consistently among the worst in the U.S., ranking sixth in the U.S. for total delays. And the problem has worsened dramatically -- delays rose more than 20 percent over the past year alone.*
>
> *Since 1970, about the time the second northwest/southeast runway was proposed, annual passenger volumes at Logan have increased by 277 percent and annual operations have increased by 156 percent.*
>
> *Logan's disproportionately high ranking in aircraft activity reflects the uniquely high levels of regional carrier flights operated with smaller, non-jet aircraft, such as CapeAir/Nantucket Airlines Cessnas. Roughly half of Logan's operations are by regional air carriers, making Logan the U.S. airport with the highest amount of regional carrier activity. Such regional carriers are significant contributors to the vitality of the New England economy. Most of New England's regional carriers have code-sharing relationships with different national and international airlines.*
>
> *The smaller planes further influence operational activity because they must have a greater separation distance from a larger jet. When a small plane follows a larger jet, there must be a separation distance of up to six miles between the two. The smaller planes are not heavy enough to withstand the turbulence of a leading jet. When the percentage of regional carriers increases, the need to provide greater separation between aircraft increases. This necessary "stretching out" of the arrival stream, while easily accommodated on a "normal" day, has a dramatic impact on congestion and delay in bad weather conditions.*
>
> *The proposed unidirectional commuter runway would allow commuter planes, which account for up to 54 percent of Logan's daily operations, to arrive and depart over water on a*

separate runway. By separating the commuter flights, the Tower would would be able to use the other runways for larger jets, allowing for the optimal number of (but not increasing) take offs and landings for both commuter planes and jets.

This runway would reduce annual delays in all conditions by more than 27 percent, increase the ability to meet community noise goals, and would result in a reduction of odor by 16 percent and ozone by 6 percent. Overall there would be a reduction in noise impacts for the majority of surrounding communities.

Question 5: Does Massport's proposal for the new runway sound logical?

Unfortunately, logic does not always prevail over politics, and for a quarter of a century the completion of the proposed runway (it was started in 1973) has been blocked by strong local politics.

To overcome the local politics the runway must have stronger support from the rest of Massachusetts and New England. Support from Cape Cod and the islands will be vital. Governor Cellucci is behind the runway. If you believe the runway is a logical solution to delays at Logan, it would help if you send him a message of support. It would help if you tell your state representative and it would be particularly helpful to tell Falmouth Representative Eric Turkington who is a member of the Joint Transportation Committee.

Time to Squeak

THE ISSUE

No doubt you have heard about or read about the runway that Massport is proposing to build at Boston Logan International Airport.

Why should Cape Codders care about what is happening at Logan?

Because Logan is our doorway to the world and Logan is the world's doorway to Cape Cod.

Why does Massport want to build the runway?

To relieve delays caused by adverse wind conditions; delays that make Logan one of the worst airports in the country in terms of delays. Last year Logan experienced 120,000 hours of delays, delays estimated to have cost the airlines and their passengers over $300 million.

How would the proposed runway reduce delays?

Aircraft take off and land into the wind. Logan has three sets of runways. Two parallel runways are aligned in a northeast/southwest direction, one is aligned in an east/west direction and one is aligned in a northwest/southeast direction. Under normal wind conditions that allow the use of all three of its available runway directions, Logan can handle 120 operations an hour. However, when there are strong winds from the northwest, the parallel NE/SW runways are not usable reducing operations to 90 per hour. In the worst case scenarios, when the E/W runway also becomes unusable, operations are reduced to 60 per hour. The proposed Runway 14/32 would give Logan a second NW runway which would alleviate the delays.

It should be noted that Runway 14/33 is not meant to increase the number of aircraft using Logan. It is simply to allow the aircraft currently using Logan to arrive and depart with out delays during adverse wind conditions.

However, the addition of 14/32 would enhance utilization of Logan at all

times. Currently, when on the approach for the same runway the smaller aircraft that represent almost half of Logan's operations have to maintain a six-mile separation behind large aircraft due to turbulence. 14/32 would provide separate approach paths for the large and small aircraft, increasing Logan's operational efficiency.

As Runway 14/32 is designed to bring aircraft in over the water rather than residential areas, the addition of 14/32 to Logan this would seem to be a win-win solution for Massport and its neighbors.

But the neighbors have mounted strong opposition to the runway. The neighbors have support from their local legislators and Congressman Joe Moakley has written to Jane Garvey, the FAA director, opposing Massport's plans. Congressman Michael Capuano has written to John DeVillars, Regional Administrator of the New England Environmental Protection Agency expressing "strong opposition" to Massport's plan for the runway.

I believe this opposition is a classic example of "Don't confuse me with the facts. My mind is made up."

The facts are simple. The runway is not designed to bring more aircraft into Logan, a misconception its opponents are spreading as gospel. It will not bring more noise to Boston's neighborhoods. The runway itself should reduce noise and any change in traffic patterns will simply redistribute the current noise.

At the FAA/MEPA hearing last Wednesday night to hear public comments on the proposed Environmental Impact Study for the runway and other airside improvements at Logan there were many public officials who spoke against the runway.

But there were also a number of businesses and associations who spoke in favor of it. They recognize that the economic future of Boston, Massachusetts and New England depend on a viable Logan Airport. These included Arthur D. Little, Associated Industries of Massachusetts, Boston Edison, Cape Air, Fidelity, Greater Boston Convention & Visitors Bureau, Hampshire House, Lily Truck Leasing, Massachusetts Business Roundtable, Massachusetts High Technology Council, Mass Insight, The New England Council, State Street Bank and the South Shore Chamber of Commerce.

At the Cape Cod Chamber of Commerce's Legislative Breakfast Friday morning, Senator Henri Rauschenbach stressed the importance of Runway 14/32 and urged all to contact Governor Cellucci and Peter Blute, executive director of Massport, to express support for the runway.

The voices against the runway are organized and loud. And, as the old saying goes, "The squeaky wheel gets the grease." It's time for the rest of us to squeak.

In addition of words of support to Cellucci and Blute, your written support of Massport's plans to the FAA and MEPA by the April 23 deadline for comments on Environmental Impact Study the would be appreciated.

New England's Economy Depends on Logan
Frank Gibson and testimony

Code	Topic 1	Topic 2	Comment	Response
141.1	Alternatives	Peak Period Pricing	...there is no question that financial deterrents to limit access to Logan are not the answer to delays at Logan caused by weather.	Comment noted.
141.2	Alternatives	Runway 14/32	Runway 14/33 is not meant to increase the number of aircraft using Logan. It is simply to allow the aircraft currently using Logan to arrive and depart without delays.	Comment noted.

NEW ENGLAND GUATEMALAN ALLIANCE

LETTER 142

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, Boston, MA 02202

4/7/99

Dear Mr. Durand,

As an active member of Boston's Hispanic community and president of the New England Guatemalan Alliance (a network of Guatemalan people and organizations established in 1995), I urge you to reject Massport's EIS regarding runway 14/32 because it is biased, inadequate and uses out-dated figures from 1993, when the 1998 data (available on www.ASC.FAA.gov) clearly shows that delays at Logan have gone down significantly since 1992. MEPA regulations require the EIS to be clearly and concisely written in order to inform the public and policy makers of proposed development and various alternatives. This is where the EIS fails miserably. 142.1

The four-volume (600 pages plus per volume!) study is not clear or concise but terribly confusing and technical even for native English speakers. It does not adequately discuss viable alternatives to runway 14/32, such as peak hour pricing or land banking for a second airport and doesn't even *mention* the obvious alternative of sending all small planes to nearby Hanscom Airport. It doesn't discuss the "conservation potential" (as required in MEPA regulations) of these alternatives on humans, nature and natural resources. Massport's EIS shows two scenarios: "Logan with the runway" and "without the runway." In the name of fairness, the EIS should explain the benefits of other alternatives. 142.2

Most importantly, Massport's EIS does not consider the devastating environmental impacts on the **populations that will be most harmed by this runway - the majority of whom are inner city, lower-income and working class people - a significant proportion of whom are people of color.** Chelsea has one of the largest Puerto Rican and Hispanic populations in the region. East Boston is presently home to the largest Central American population in Boston. Jamaica Plain, Roxbury, Dorchester and the South End also house large Hispanic, Caribbean and African populations. Aren't MEPA and other Federal and State regulations supposed to protect against transportation development that adversely impacts a disproportionate number of minority and lower income people? 142.3

Please reject Massport's EIS because of these and other inadequacies. Runway 14/32 is a short-sighted and unfair proposal. Massachusetts needs long-term regional transportation planning that will equitably distribute airplane noise, air pollution and auto congestion throughout various areas of the state, rather than supersaturate populations who already bear the lion's share of negative environmental impacts from regional transportation including but not limited to Logan Airport, three tunnels, highways, mass transit and hazardous oil tanks. This is not NIMBY, but rather a simple case of when is enough *enough* for inner city neighborhoods? Thank you. 142.4

Code	Topic 1	Topic 2	Comment	Response
142.1	Analysis Assumptions/ Methodologies	Base Year	...Massport's EIS regarding runway 14/32 [should be rejected] because it is biased, inadequate and uses out-dated figures from 1993, when the 1998 data...clearly shows that delays at Logan have gone down significantly since 1992.	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent and continued to increase in 2000. In 2000, Logan Airport was second most delayed in the United States for arrivals. This represents the worst rank in Logan Airport's history. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
142.2	Environmental Review Process	MEPA	[The DEIR does not satisfy MEPA because it does not study a full range of alternatives.]	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
142.3	Environmental Justice	Impacts	...Massport's EIS does not consider the devastating environmental impacts on the populations that will be most harmed by this runway—the majority of whom are inner city, lower-income and working class people—a significant proportion of whom are people of color.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
142.4	Environmental Justice	Impacts	Massachusetts needs long-term regional transportation planning that will equitably distribute airplane noise, air pollution and auto congestion throughout various areas of the state, rather than supersaturate populations who already bear the lion's share of negative environmental impacts....	Regional initiatives to improve the efficiency of the region's inter-city transportation network have been studied since 1989. Section 2.1 of the Supplemental DEIS/FEIR summarizes relevant planning studies and their major conclusions. A regional transportation strategy that includes the expansion of regional airports, the development of high-speed rail, and the construction of Runway 14/32 and other infrastructure improvements at Logan Airport has evolved from these important studies. All the major improvements to the regional transportation system have been implemented except for improvements to Logan Airport's airfield. The regional airports have been experiencing tremendous growth in services and passenger traffic since 1996 and Amtrak introduced its high-speed Acela train service between Boston and New York in December 2000. Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. While greater use of the regional airports and high-speed rail will provide relief to Logan Airport, the proposed Airside Project provides clear benefits at current, as well as future, traffic levels. The benefits will only increase in the future, even as regional transportation developments act to reduce the rate of future growth at Logan Airport.

EOEA #10453

NPC Noise Pollution Clearinghouse

LETTER 143

Protecting the Commons:

Our effort to control second-hand noise is part of a greater effort to protect that which is held in common by the public from exploitation, abuse, and degradation. Other efforts to protect the commons are concerned with protecting our public lands and parks; air, airways, water, and waterways; habitat, species, and bio-diversity. What these efforts share is the recognition that our well-being is enhanced when the commons is used to maximize opportunities for everyone, and degraded when the commons is used to maximize profits or opportunities for a few, or to maximize only a few opportunities.

Some individuals and businesses feel that they have a right or the freedom to use a common resource in any way they see fit. Perhaps these people are mistakenly extending their own private property rights to that which is publicly owned or cared for and not exclusively their own. Perhaps they do not realize what most of us learned on the school yard years ago: "that my right to swing my fist ends at your nose." Or, perhaps they do not recognize the soundness of our parallel claim "that my right to create noise ends at your ear." In any case, these people are acting as bullies, claiming rights and freedoms that are not theirs while degrading resources that are ours.

Polluting the commons is not a right. Our effort to reduce noise pollution is similar to other efforts to reduce pollution and reassert our collective stewardship over the commons. Whether the issue is second-hand smoke, elevated mercury levels, or ground level ozone, the strategy is to protect the environment and our health and well-being by creating an ethic of the commons.

In seeking to advance an ethic of the commons, we first need to recognize that competing uses that exclude other uses of the commons or damaging uses that detract from other uses are not wise uses of a public good. The commons should be used in as many non-competing, non-damaging ways as possible. Noise, like many other pollutants, precludes many enjoyable uses of the commons and is not a wise use of the commons: loud late night parties, early morning garbage pick-up, or aircraft take-offs trump sleeping, reading, working, or listening to music.

We are seeking to improve human well-being by establishing an ethic for the commons that allows for as many non-consumptive and non-rival uses of the commons as possible. Human well-being is enhanced when individuals or groups such as the Noise Pollution Clearinghouse succeed in two ways: first, by minimizing damaging uses of the commons, and second, by maximizing the opportunities for non-competing uses. With respect to noise, help us by spreading the message that good neighbors keep their noise to themselves.

Subject: Noise protection in communist Hong Kong
From: "Ron Steinbach" <RonSteinbach@prodigy.net>
Date: 4/14/99 6:52 PM Pacific Daylight Time
Message-id: <7f3rd2$15ko$1@newssvr01-int.news.prodigy.com>

The following excerpt is from the South China Morning Post, October 14, 1998:

Residents urge 11pm flight ban

Noise from overnight flights has exceeded acceptable levels in Eastern District . . .

Residents have succeeded in getting flights rerouted from midnight until 7am starting from next Sunday,

but now they want rerouting to start from 11pm.

Provisional Urban Councillor Wong Kwok-hing, who represents Eastern District, has been measuring

noise from the flight path between 11pm and midnight.

It was found that noise from eight planes flying over the Wharf Centre in North Point on Monday exceeded the 55 decibels recommended by the Environmental Protection Department.

The average noise level was 66.3 decibels, with the highest level reaching 70.4, Mr Wong said.

My question is why the communist government in Hong Kong appears to be more sensitive to aircraft noise experienced by its citizens than the democratic government in the United States? 143.1

.y. Homeowners Flee Airport Noise

.c The Associated Press

By STEVE BAILEY

LOUISVILLE, Ky. (AP) – Pat Philpott has lived in the same home for more than three decades. Naturally, she felt anxious when she leamed she would have to move to make room for an airport's expansion.

That was until she found out she could take everything with her: her sofa, her television, her antique dresser – and all her neighbors.

Mrs. Philpott, 58, is among nearly 300 homeowners in Minor Lane Heights who over the next several years will pack up and move about 8 miles to the southeast.

It's part of an ambitious relocation plan that will keep their tiny incorporated community of about 1,700 residents at the southern edge of suburban Louisville from being dissolved.

``This community does a lot of things together – Easter egg hunts, senior citizen dinners, picnics and festivals," Minor Lane Heights Mayor Fred Williams said. ``Why let go of all of that if you don't have to?"

On one side of Mrs. Philpott's new home will be the family she's lived beside for nearly 30 years. On the other side will be a woman who's lived across the street for 26 years. Other current neighbors will be across the street.

first, I didn't want to move, not at all," Mrs. Philpott said. ``I've lived here a long time and raised my sons here and made some .t friends. I didn't want to give all that up."

Neither did many other residents, who banded together to make sure long-standing relationships would not be razed in the same fashion as their homes.

``We've lived here for 14 years and my parents live right next door," said 43-year-old Gerald Jackson, who along with his wife and two children will be among the first 50 families to have moved into their new homes by Thanksgiving.

``Everybody here looks out for each other like family. I couldn't imagine relocating anywhere away from a lot of these people, especially my folks," he said.

A groundbreaking ceremony for the new community was held March 28, but the process began more than five years ago when Louisville International Airport announced plans to open two new runways. That sparked outcries that the added noise would further burden thousands of already frazzled homeowners below the airport's flight path.

``From about 10 p.m. to 7 a.m., the roar is constant," Williams said. ``But it's not just the noise. The airport here has a great track record, but what goes up must come down. Eventually, there's going to be some kind of disaster."

A solution was proposed: a $285 million federal and state grant program to buy out more than 3,700 area property owners so they could purchase homes in other locations.

To those who had lived in Minor Lane Heights for years, however, that wasn't good enough. They told airport officials they would agree to move on the condition that residents could move together.

`` n this whole situation came up about five years ago, the phones were ringing off the hook with people asking, `Where am I

going to go?' and `What am I going to do,"' Williams said.

``Someone proposed the idea of moving together. Right away, people started saying it couldn't be done. But our attitude was `Why ?' These days, you can do just about anything you want if you put your mind to it."

me residents have taken the buyout money and moved elsewhere. But most, about 300 of 440 homeowners, have chosen to relocate to the new city, called Heritage Creek.

``Everybody is tickled to death with this," said city Clerk Jan Skeeters. ``And the excitement really picked up when people started picking their lots. Even though they just see their names on a colored dot on a layout board, it's become reality."

The Federal Aviation Administration spends millions of dollars annually to help people living near airports cope with the unsettling problem of jet noise, soundproofing some houses and buying and tearing down others. The budget for the program was $200 million last year.

In this situation, the agency and the airport each chipped in $10 million to help purchase 287 acres of land at the new site.

Residents will be able to sell their property to the program to buy land in the new community, where they will move into a home comparable to the one they sold.

About 350 houses will be built in the first phase of construction with more planned over the next several years. Williams said the three-bedroom, one-bath homes will average about 1,000 square feet, although residents will be allowed to pay more for larger lots or amenities their current homes lack.

The new city hall will be a 100-year-old building already on the property, which officials plan to begin renovating as soon as the first residents move into their new homes.

``A few people have asked me about the downside to this situation," Skeeters said. ``Other than the fact they've got a lot of fond memories in those old houses, what possible downside is there?"

Something in the air

By Harvey Black

the health of people who service jet aircraft could be harmed by aerosols of the fuel. At a meeting next week in San Antonio, Texas, researchers will describe animal studies suggesting that these aerosols damage the lungs and have subtle neurological effects.

Most military and commercial jets use a kerosene-rich fuel called JP-8 or Jet A, which has always been considered safe. But scientists are now starting to investigate the risks of breathing the aerosols of unburnt fuel that shoot into the air when an aircraft starts its engines.

Mark Witten, a respiratory physiologist at the University of Arizona in Tucson, has exposed rodents to aerosols of JP-8 containing droplets between 1·5 and 1·8 micrometres across--similar to those created by jet engines.

Even a single, hour-long exposure to an aerosol containing 50 milligrams of JP-8 per cubic metre increased lung permeability in mice and caused the loss of cilia, the hair-like projections that waft dirt out of bronchial tubes. "This will allow dust, pollen and other stuff in the lungs to set up a chronic inflammatory state," says Witten.

Other researchers are studying the effects of repeated exposure to JP-8. Carol Baldwin of the University of Arizona exposed five rats to aerosols containing 1000

and they said they seem to have more colds, more bronchitis, more chronic coughs than the people not exposed to jet fuel," says Witten.

At next week's meeting, sponsored by the US Air Force, the Environmental Protection Agency and the National Institute of Occupational Safety and Health, officials hope to lay down a plan for future epidemiological studies.

"What we're trying to do is develop exposure standards for anyone who works around an aircraft," says Major Les Smith of the Brooks Air Force Base in San Antonio, who chairs an Air Force committee looking at the health and environmental effects of JP-8.

ITHACA, N.Y. -- The constant roar from jet aircraft can seriously affect the health and psychological well-being of children, according to a new Cornell University study. The health problems resulting from chronic airport noise, including higher blood pressure and boosted levels of stress hormones, the researchers say, may have lifelong effects.

143.2

"This study is probably the most definitive proof that noise causes stress and is harmful to humans," says Gary Evans, a professor of design and environmental analysis in Cornell's College of Human Ecology. This is, he says, the first longitudinal study of noise and human beings to look at the same group of individuals before and after noise pollution.

Other studies have been cross sectional, comparing people exposed to noise to well-matched controls who were not subjected to noise. Evans, an environmental psychologist and an international expert on environmental stress (such as noise, crowding and air pollution) and his German and Swedish colleagues, Monika Bullinger and Staffan Hygge, respectively, reported their findings in the January issue of Psychological Science, published by the American Psychological Association.

The researchers looked at 217 third- and fourth-grade children in rural areas 22 miles from Munich, Germany, before and after the opening of a new airport.

About half the children live in an area under the flight path of the new international airport; the others, who were matched for age, parental jobs, family size and socioeconomic status, live in quiet areas. The children were tested for blood pressure, stress hormone levels and quality of life six months before the airport was completed as well as six and 18 months after it opened.

The children in the chronic noise group experienced modest but significant increases in blood pressure and significant increases in stress hormones (epinephrine, norepinephrine and cortisol) while the children in the quiet areas experienced no significant changes. Eighteen months after the airport opened, the children exposed to the chronic aircraft noise also reported a significant decline in their quality of life.

"Although the increases in blood pressure were modest in the children living

under the flight path, they may predict a greater likelihood of having higher blood pressure throughout adulthood," says Evans. There are indications, he says, that elevated blood pressure in childhood predicts higher blood pressure later in life.

Boosts in stress hormones also are of concern because they indicate that noise induces physiological stress. These hormones are linked to adult illnesses, some of which are life-threatening, including high blood pressure, elevated lipids and cholesterol, heart disease and a reduction in the body's supply of disease-fighting immune cells.

Evans' and his colleagues' new study adds powerful evidence to cross- sectional and animals studies which have shown higher stress levels in children and adults working and living in chronically noisy environments.

Evans also reported last year that New York children living near an international airport tended to be poor listeners and did not read as well as matched children in quiet schools. Later this year, Evans hopes to report on how chronic noise affects reading, learning and mental health in the Munich study group.

The study was supported, in part, by the Society for the Psychological Study of Social Issues, the National Institutes of Health, the Nordic Scientific Group for Noise Effects, the Swedish Environmental Protection Agency and the German Research Foundation.

Noise Pollution Clearing House

Code	Topic 1	Topic 2	Comment	Response
143.1	Noise	Nighttime Noise	[Why does Hong Kong have a lower allowable decibel level (55) than Logan?]	The comment is unclear and difficult to interpret. Hong Kong's noise standards for its new Chek Lap Kok (CLK) Airport utilize a totally different noise metric (the Noise Exposure Forecast (NEF)) than is used at airports in the United States, and the allowable level is not 55 dB. Also, it is the FAA, not Massport, that establishes guidelines for land use compatibility in the United States. It should not be surprising that rule making agencies of two such widely different countries and cultures have differing needs and objectives.
143.2	Public Health	Effects	The constant roar from jet aircraft can seriously affect the health and psychological well-being of children, according to a new Cornell University study.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

RE: Runway expansion at Logan

Number of pages including cover sheet: [2]

Message:

I am writing to express my strong opposition to the runway expansion at Logan. In expressing this opposition, I want to make it clear that I am not an anti-growth fanatic but someone who sees that this is another example of the State taking a bandaid solution to a problem that will not address the real problem over the long term and will, as usual, impose its burden primarily on those of lower income.

Twenty-five years ago the State made a commitment to find an alternative to help relieve the congestion at Logan that would result from the expected growth of air traffic. Since that time, the State and its politicians have continually let opportunities pass to help address this issue. This has included letting Weymouth air strip go as a possible alternate, failed to move on making Worcester a viable alternative and failing to push for Hanscom to provide some relief.

Now you are hypocritically hiding behind some screen that you are pursuing alternatives in Manchester and Warwick. Who are you kidding with this approach of having your cake and eating it too? The main reason these alternatives are expanding so much has nothing to do with your actions or any other actions of politicians in this State. It is simply the marketplace. This is happening because Logan is such a mess and the State has failed to fix this situation. The other reason is that Southwest Airlines has provided very inexpensive reliable service out of these airports. It is for these reasons that I, who live in Roslindale, go to Rhode Island. It is not because of your efforts. Using this as evidence that you are seeking alternative solutions really only illustrates your willingness to pass the buck politically to other States to solve a Massachusetts problem.

I am opposed to the runway expansion at Logan for the following reasons:

- As mentioned above, this is only a short-term band-aid solution and in another five years we will have even fewer options available to help solve the problems that will exist. 144.1
- It places an undue and unfair burden of noise pollution on areas already bearing too much of the burden for the entire State. I can appreciate the argument of people in the Lexington and Concord areas that people don't want all the noise pollution over those historic areas (that are just as much my areas as theirs). However the Arnold Arboretum, Mt Auburn Cemetery, and the Emerald Necklace are also historic areas that draw 144.2

hundreds of tourists who would appreciate more peace and quiet. For many years Hanscom was a viable airport with a considerable amount of traffic from large military planes so a small increase of corporate and small jets is not unfair. I am willing to take 80% of the burden of noise pollution while I am sitting on my porch, but I am unwilling to take 100%.

- As proven by their unwillingness to provide for a solution for the last 20 years as well as countless other broken promises, Massport can't be trusted in their promise that this will only be used to provide an alternate landing route to minimize delays, not to increase landings. In five years when the burden on Logan is even greater this promise will fall by the wayside. 144.3

- Logan and the area around it simply cannot handle any more vehicular traffic. Logan is on a peninsular with vehicular access through pushing on residential neighborhoods. It cannot take any more. This comes at a time when public health officials are increasingly concerned about the epidemic in childhood asthma. 144.4

- There is inadequate space at Logan to provide storage and ancillary facilities for shippers and the situation will only get worse with the construction of a new runway. This will increasingly force trucks and storage spaces into residential and retail areas. This was recently illustrated by one developer recently announcing plans to develop more than 100,000 square feet of warehouse space miles away from the airport. 144.5

Until such time as the State takes the following actions, I will be fully opposed to the expansion at Logan:

- Worcester Airport is built up as a viable alternative. This would include the State providing a direct access highway and the State pushing airlines, shippers, and corporate jets to use Worcester as an alternative. 144.6

- Pursue "peak-time" pricing to force corporate jets out as a cause of delays. 144.7

- Develop Hanscom as an alternate for corporate jets. This would not radically increase noise or vehicular traffic in the area but it would be another cog in the effort to reduce delays at Logan. Many of these jets are servicing clients in the Rte 128 area anyway so it would be in their best interest. 144.8

- Further pursue Manchester and Warwick as alternatives. This would include establishing train service to T.F. Green. 144.9

Code	Topic 1	Topic 2	Comment	Response
144.1	Alternatives	Runway 14/32	...this is only a short-term band-aid solution and in another five years we will have even fewer options available to help solve the problems that will exist.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
144.2	Noise	Impacts	It places an undue and unfair burden of noise pollution on areas already bearing too much of the burden for the entire state.	Projected changes in flight patterns and associated noise shifts are consistent with the PRAS goals, which were studied and approved by the community when established. Activity increases over certain communities are offset by activity reductions over other severely impacted communities and by activity increases over water.
144.3	Alternatives	Runway 14/32	Massport can't be trusted in their promise that this [runway 14/32] will only be used to provide an alternate landing route to minimize delays, not to increase landings.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport.
144.4	Ground Transportation	Access to Logan	Logan and the area around it cannot handle any more vehicular traffic.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
144.5	Cumulative Impacts	Landside Improvements	There is inadequate space at Logan to provide storage and ancillary facilities for shippers and the situation will only get worse with the construction of a new runway.	Logan Airport's real estate is admittedly less than the desirable size. Since the existing area cannot be expanded, Massport proposed the Airside Project and is investigating other redevelopments to maximize efficiency, including relocating non-essential facilities off-airport. Runway 14/32 will be located on fill that was prepared for this purpose 25 years ago. The runway will not increase airfield capacity, but will dramatically reduce aircraft and passenger delays during northwest wind conditions.

Maser/ALDW7469/Data/Reports/Renumbered Comments and Responses/Interest Groups 3.doc

Code	Topic 1	Topic 2	Comment	Response
144.6	Regional Transportation	Regional Airports	[Improve] Worcester Airport...as a viable alternative.	Massport has a long-standing relationship with the City of Worcester to aid Worcester Regional Airport in reaching its full potential, thereby improving the efficiency of the New England air transportation network. Massport assumed operational control of the Worcester Regional Airport on January 15, 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of Massport's efforts to promote increased utilization of Worcester Regional and the other regional airports.
144.7	Alternatives	Peak Period Pricing	Pursue "peak-time" pricing to force corporate jets out as a cause of delays.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport. See Section 4.5 of the Supplemental DEIS/FEIR.
144.8	Regional Transportation	Regional Airports	Develop Hanscom as an alternate for corporate jets.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
144.9	Regional Transportation	Regional Airports	Further pursue Manchester and Warwick as alternatives. This would include establishing train service to T.F. Green.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Pilot Block Neighborhood Association

LETTER 145

Pilot Block Neighborhood Assoc.
93 Pembroke St.
Boston, MA 02118
April 9, 1999

The Honorable Argeo Paul Cellucci
Governor Commonwealth of Massachusetts
State House - Rm 360
Boston, MA 02133

Dear Governor Cellucci:

I am writing on behalf of Pilot Block Neighborhood Association to urge you to reconsider your position on expanding Logan Airport with Runway 14/32. Very few cities have airports which are as close to their large population center as Boston. Boston and many surrounding towns and cities have long suffered from considerable noise and air pollution from the airport. The South End has had a dramatic increase in noise in the last year and the new runway will only make this worse. We all know that Logan Airport is here to stay and that we will have to continue to work to minimize the impact on its neighbors. But it is time to share the burden with other parts of this state. 145.1

Almost all major cities are served by more than one airport. With 57% of Logan's passengers coming from outside Rte. 128, we need to develop another airport to take the overload from Logan . And we need to develop a regional plan that will take us into the future, not settle for a stop gap measure that will help, at most, for five years and will place an increased burden on local communities. There are several options already in existence, Hanscom field (already underutilized), Worcester (which could be connected by a high speed rail line), and Ft. Devens. Not only would these airports decrease traffic and delays at Logan, but they could lighten the traffic on some of the most congested highways in Boston and give much easier access to air transportation to many of the 57% who live outside 128. And we need to look further afield to consider what makes sense in terms of other regional airports like Manchester and Providence. 145.2 145.3 145.4

Increasing air traffic at Logan is not good for business. Nobody wants to be in a city with so much airplane noise that you can't carry on a conversation. Nobody wants to endure the traffic congestion on the Central Artery and the lack of infrastructure to support increased air traffic. Nobody wants an unhealthy city, and the areas affected by the airport have elevated levels of respiratory problems and cancer. These need to be studied further. We shall urge the office of environmental affairs to do careful studies of these health risks. 145.5 145.6

We can develop this city in ways that don't sacrifice our quality of life, if we are ready to put the thought and committment into this goal. We need to have a Massport that makes good on its past commitments and that involves the communities it serves, not one that goes off and does its own thing regardless.

Please reconsider your position. Pilot Block Neighborhood Association voted unanimously to oppose the new runway 14/32.

Yours truly,

Cynthia J. Steil
President Pilot Block Neighborhood Assoc.

Letter 145

Cynthia J. Steil, President

Code	Topic 1	Topic 2	Comment	Response
145.1	Alternatives	Runway 14/32	The South End has had a dramatic increase in noise in the last year and the new runway will only make this worse.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
145.2	Regional Transportation	Regional Airports	With 57% of Logan's passengers coming from outside Rte. 128, we need to develop another airport to take the overload from Logan.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport.
145.3	Regional Transportation	Regional Airports	....we need to develop a regional plan that will take us into the future, not settle for a stop gap measure that will help, at most, for five years and will place an increased burden on local communities.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. While regional alternatives will relieve traffic growth pressures at Logan Airport, the proposed airside improvements are necessary and provide clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail services act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
145.4	Regional Transportation	Regional Airport	...Hanscom field... Worcester... and Ft. Devens. ....decrease traffic and delays at Logan... [and] they could lighten the traffic on some of the most congested highways in Boston and give much easier access to air transportation to many of the 57% who live out side 128.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 19991999 and is in the process of preparing a Draft EIS/EIR, which is expected to be filed in October 2001.
145.5	Purpose and Need	Delay	Increasing air traffic at Logan is not good for business. Nobody wants to be in a city with so much airplane noise that you can't carry on a conversation. Nobody wants to endure the traffic congestion on the Central Artery and the lack of infrastructure to support increased air traffic.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

Code	Topic 1	Topic 2	Comment	Response
145.6	Public Health	Effects	...the areas affected by the airport have elevated levels of respiratory problems and cancer. These need to be studied further. We shall urge the office of environmental affairs to do careful studies of these health risks.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

LETTER 146

PRI Automation

April 7, 1999

PRI Automation, Inc., headquartered in Billerica, Massachusetts, is a leading global supplier of advanced factory automation systems and wafer-handling solutions that enhance the competitiveness of semiconductor manufacturers and OEM equipment suppliers. PRI is a member of The Massachusetts High Technology Council, Inc.

PRI Automation, Inc. has been in Massachusetts since it was originally founded in 1982 and currently employs over 500 Massachusetts residents out of a total of 1200 worldwide. We are a global company with a customer revenue base and operations at numerous locations in the U.S., Europe and Asia.

PRI spends on average $2.3 million in airfare traveling throughout the United States, Canada, Asia and Europe, installing and servicing customers' equipment and traveling between our facilities in California, Toronto, Europe and Asia. PRI's travel has increased at a rate of 20% annually and is expected to continue at that rate.

PRI employees take 2100 trips per year, most on short notice, leaving at all times of the day and night. In our business it is vital to meet the customers' demands all of which include arriving on time for sales meetings, and installing and servicing the equipment when the customer needs us there. Arriving too late could mean the loss of a potential contract. Efficiency is critical to our economic competitiveness. As PRI continues to strive for global presence, access to customers around the country and around the world is becoming increasingly important in order to remain a contender.

Delays at Logan Airport have been a constant loss to PRI in business time, and labor and travel costs as well as frustration to PRI travelers and inconvenience to customers visiting PRI headquarters. The proposed runway will alleviate the aircraft arrival and departure delay problem at Logan. Alternative airports will reduce congestion at Logan but not the delays, which will continue as a result of any wind related problem. New England weather is bad enough without adding wind direction to the list of delaying factors. 146.1

Another concern of PRI's is our employee's safety. The proposed changes will lower approach minimums for Logan's remaining four runways to industry standards. The lower minimums will give the pilots more time to decide whether to abort a landing. Reduced minimums will enhance safety and ease delays while giving air traffic controllers a choice of runways under poor weather conditions.

PRI employees have supported the use of regional airports such as Providence and Manchester but those airports do not meet the needs of all PRI travelers, nor do these regional airports meet the needs of our customer base who are worldwide. Traveling from Manchester and Providence is often more expensive, requires connections and flight options are insufficient. We support the use of these alternative airports but Logan will continue to be our major airport. 146.2

PRI's preferred airline carrier, United Airlines, will be spending $50 million to expand their operations at Logan Airport. According to the statistics, Logan Airport, the 17th busiest in the country had 120,000 hours of delays in 1998 and is the sixth worse airport for delays in the nation. The delays have been estimated to cost $310 million to airlines and passengers. For the second time in two months, all the major U.S. airlines have increased ticket prices by 7%. Preventable delays at Logan will only impact negatively on ticket prices. For an airline, time on the ground is money lost.

While remaining sympathetic to the needs of the neighboring towns of Logan Airport, PRI Automation, Inc. supports the proposed "delay-reduction runway" plan. The plan is a reasonable solution that will help the airport operate closer to its full potential while balancing the interests of the surrounding communities. 146.3

Sincerely,

Wendy Peters

Provincetown, MA 02657
(508) 487-2313

LETTER 147

22 April, 1999

BY OVERNIGHT MAIL

Secretary of Environmental Affairs
Attn. MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

Dear Mr. Pugsley:

Attached please find a petition is support of runway 14/32 and in opposition to the establishment of peak period pricing at Logan Airport. This petition was circulated at the Provincetown Business Guild meeting held on April 14, 1999 and signed by every member present. In addition many non Provincetown Business Guild members have have sought me out to sign the petition.

The Provincetown Business Guild is an association comprised of two hundred seventy five (275) businesses located in Provincetown and the lower cape. The Provincetown Business Guild opposes peak pricing because it would end year round air service to Provincetown and the region. The majority of our members depend on Cape Air for year round air service. It is a vital link to Boston providing: (a) service in the case of medical emergencies; (b) convenient air travel for tourists traveling to Provincetown (our local economy is tourist driven); and (c) year round transportation for many individuals whose businesses are located in Provincetown with clients and customers located elsewhere in the country.

The Provincetown Business Guild supports the construction of proposed runway 14/32 and strongly urges you to prevent the implementation of peak period pricing at Logan now and at any time in the future. It is time to permanently shelve this idea that will have such a detrimental effect on the health safety and welfare of the region. 147.1

Sincerely yours,

Gary Reinhardt, President
Provincetown Business Guild

Petition in Support of Runway 14/32 and in Opposition to Increased Peak Period Pricing

Whereas, Provincetown relies on air service between Boston and Provincetown for (a) service for medical needs: (b) convenient air travel for tourists visiting Provincetown where tourism is the primary industry; and (c) year round transportation for many Provincetown and lower cape residents whose businesses are based in Provincetown with clients and customers located elsewhere in the country or abroad: and

Whereas, proposed runway 14/32 for small aircraft will increase efficiency and safety at Logan Airport without increasing either noise or air pollution over any Boston neighborhoods: and

Whereas, increased peak period pricing will make it economically impossible to continue the Boston/Provincetown route to the detriment of Provinctown's safety and economy,

WE THE UNDERSIGNED, support the development of runway 14/32 and oppose any increase in peak period pricing.

Letter 147
Provincetown Business Guild
Gary Reinhart, President

Code	Topic 1	Topic 2	Comment	Response
147.1	General Support		The Provincetown Business Guild supports the construction of proposed Runway 14/32 and strongly urges you to prevent the implementation of peak period pricing at Logan now and at any time in the future.	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

LETTER 148

22 April, 1999

BY OVERNIGHT MAIL

Secretary of Environmental Affairs
Attn. MEPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

Dear Mr. Pugsley:

148.1

The Provincetown AIDS Support Group wishes to express its support of runway 14/32 and opposition to the establishment of peak period pricing at Logan Airport.

The Provincetown AIDS Support Group has over 260 clients, many of whom depend on Cape Air for fast transportation to Boston Medical services. We oppose peak pricing because it would end year round air service to Provincetown and the region. It is a vital link to Boston providing air service in the case of medical emergencies. There is no substitute service available to our clients.

148.2

The Provincetown AIDS Support Group supports the construction of proposed runway 14/32 and strongly urges you to prevent the implementation of peak period pricing at Logan now and at any time in the future. It is time to permanently shelve this idea that will have such a detrimental effect on the health safety and welfare of the region.

Sincerely yours,

Gary Reinhardt, President
Board of Directors, PASG

Mitigation Strategies for Logan as Proposed by *Save Our Heritage* – a community group

The most challenging and pressing issue facing Massport with regards to Logan airport is the issue of noise pollution. Indeed, this is an issue that effects any community in the country that "hosts" an airport. In order to address this issue, Massport should begin the FAR Part 161 process. Under the Airport Noise and Capacity Act of 1990, this is the only formal way an airport operator can legally restrict airport noise. If a FAR Part 161 proposal for Logan were to be accepted by the FAA, this would allow for noise surcharges, limitation on numbers of operations, limitation on the ultimate size of the airport, or special flight procedures. Unfortunately, no airport has ever had a Part 161 proposal accepted by the FAA. In fact, the FAA has made it clear that they do not intend to accept a Part 161 proposal. However, this is really the only binding way to control Logan growth. Through coordinate and combined energy of the community, the state and legislators, there may even be the possibility of establishing breakthrough and instigating change at the national level. 149.1

An Airport noise taskforce under the direction of the Secretary of Environmental Affairs should be created. The mission of the taskforce should be as follows: 149.2

1) Review all current Massachusetts environmental regulations with respect to noise
2) Review the work of other states and countries in the area of airport noise regulation
3) Propose state standards for measurement of noise and noise impact
4) Develop and propose a section in the MEPA regulations related to noise
5) Make recommendations defining the objectives of any Logan FAR Part 161 Process
6) Make recommendations on the content of the noise discussions in the next Logan GEIR

The task force would consist of recognized noise experts from both the public and private sectors who are recognized for their objectivity. Additionally, to gain the support and confidence of the citizens the task force should include community activists.

Massport should work with the state to develop a strategy to move traffic from the air to other forms of transportation and truly build a regional, intermodal system. In particular, the new high-speed rail system offers an excellent opportunity for Massport. Massport could: 149.3

1) Subsidizing and or build parking for rail stations
2) Advertise in support of high speed rail

3) Facilitate access to rail stations through other forms of public transportation
4) Place a surcharge on air operations that offer service to areas serviced by high speed rail. This would encourage the use of rail over the use of air for short haul trips and cut down on the amount of traffic in and out of Logan.

The Governor should set a timetable of 10 years for a "balanced airport noise trade" with our adjacent states and direct Massport to accomplish this. A study of people who come to Logan from New Hampshire and Rhode Island will show that Logan is still carrying a significant and disproportionate load of out-of-state passengers. A regional program should be developed so that each state is carrying its share of the aviation traffic load. Massachusetts should not be a "net importer" of aviation noise pollution, as it has been for the past 20 plus years. This corresponds to a very real and meaningful shift of the noise burden. Although this could be built into a mitigation plan for Logan and proposed by Massport in the EIR, it would be a great opportunity for the Governor to show that the state understands citizens' concerns and is prepared to demonstrate leadership on this issue. 149.4

Massport and the state should support and facilitate the Rt. 3 North construction project. Rt 3 North congestion is the primary barrier to the use the Manchester Airport. New Hampshire has made improvements on its section of Rt. 3. If the Massachusetts section of Rt. 3 were improved and the New Hampshire tolls removed Manchester would become a dependable and preferred option for many travelers. The use of Manchester for commuter flights by Massachusetts's travelers could offset the use of Logan for international and long-range flights by New Hampshire travelers. 149.5

Massport should use whatever legal techniques are available to ensure that quieter aircraft use Logan. If possible, carriers should be discouraged from using Stage 2 aircraft that have been "hushkitted" to Stage 3. These aircraft are much louder than true Stage 3 aircraft. This will be challenging, such "discrimination" is prohibited by Federal regulation. However, there may be creative ways for Massport to "encourage" operators to not use hushkitted aircraft. It is interesting to note that currently the European Union is working to ban the use of hushkitted aircraft in European airports. 149.6

Massport require the publication of the names of users of hushkitted aircraft, other loud aircraft, or late night operations. Additionally, a public monthly report of number of infractions by carrier should be published. These reports should explain the extra noise impact of these operations. This would allow the public to put pressure on the operators. However, Massport is under extreme pressure not to do this by the operators. This is an issue of disclosure, which could fall under the auspices of MEPA, and the Office of 149.7

Environmental Affairs. MEPA and OEA could require that this be done as part of the acceptance of the EIR. In this way, the communities could vent their frustration to the appropriate parities, the worst offenders. This could have a very real effect on the behavior of the operators, and it would also circumnavigate FAA regulations. The communities could focus on the operators instead of on Massport and effect change through market pressure.

Massport, the Governor, and the Secretary of Environmental Affairs should put in a formal request, in the form of an open letter, to the FAA regarding the proposed Stage 4 program for the next generation of quieter aircraft. This letter should explain that communities can no longer accept the noise of airports and the forecasted growth of airports can not go forward without Stage 4 mitigation. A timetable for the development and deployment of Stage 4 aircraft by the airline industry should be demanded. 149.8

Today, local officials are seen as attempting to protect citizens from airport noise. The state, rightly or wrongly, is viewed as a creator of airport noise. The Governor and the Secretary of Environmental affairs need to establish a position of leadership on the issue of protection from noise. This can and should be done through both the EIR process and through unilateral leadership initiatives from the Governor and the Secretary.

Code	Topic 1	Topic 2	Comment	Response
149.1	Environmental Review Process	FAA/NEPA	Massport should begin the FAR Part 161 process. Under the Airport Noise and Capacity Act of 1990, this is the only formal way an airport operator can legally restrict airport noise.	Massport prefers to exhaust all available measures on a voluntary basis rather than embark on a FAR Part 161 Study. To date no commercial airport has been able to get FAA approval for a noise rule under the provisions of the regulation.
149.2	Environmental Review Process	MEPA	An Airport noise taskforce under the direction of the Secretary of Environmental Affairs should be created.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
149.3	Regional Transportation	Passenger Rail	Massport should work with the state to develop a strategy to move traffic from the air to other forms of transportation and truly build a regional, interrmodal system. In particular, the new high-speed rail system offers an excellent opportunity for Massport.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
149.4	Regional Transportation	Regional Airports	The Governor should set a timetable of 10 years for a "balanced airport noise trade" with our adjacent states and direct Massport to accomplish this. A regional program should be developed so that each state is carrying its share of the aviation traffic load. Massachusetts should not be a " net importer" of aviation noise pollution, as it has been for the past 20 plus years.	This is a matter for the United States Congress and individual state legislatures.
149.5	Regional Transportation	Regional Airports	Massport and the state should support and facilitate the Rt. 3 North construction project [because] Rt. 3 North congestion is the primary barrier to the use the Manchester Airport.	Comment noted.
149.6	Noise	Hushkitted Aircraft	Massport should use whatever legal techniques are available to ensure that quieter aircraft use Logan. If possible, carriers should be discouraged from using Stage 2 aircraft that have been "hushkitted" to Stage 3.	Massport commits to begin discussions with the FAA with the goal of instituting restrictions, either locally or nationally, on the use of hushkitted Stage 3 aircraft at Logan Airport.
149.7	Environmental Review Process	MEPA	[MEPA should require] Massport [to publish]... the names of users of hushkitted aircraft, other loud aircraft, or late night operations. Additionally, a public monthly report of number infractions by carrier should be published. These reports should explain the extra noise impact of these operations.	Refer to response to Comment 149.6.
149.8	Noise	Hushkitted Aircraft	Massport, the Governor, and the Secretary of Environmental Affairs should put in a formal request, in the form of an open letter, to the FAA regarding the proposed Stage 4 program for the next generation of quieter aircraft.	Refer to response to Comment 149.6.

LETTER 150

The Seaport Alliance for a Neighborhood Design (SAND)
300 Summer Street Boston MA 02210 617-423-4299
www.bostonseaport.com

April 22, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge St. 20th Floor
Boston, MA 02202

Re: EIS/EIR #10458 — Logan Airside Improvements

Dear Secretary:

The Seaport Alliance for a Neighborhood Design is a community group based in the Fort Point Channel neighborhood of South Boston. Our members, including many Boston-area residents and business owners, have advocated for the planning of a "neighborhood" in the South Boston Seaport District. A chronicle of this effort is documented on our website at www.bostonseaport.com.

We are addressing the Massport EIR for Logan Airside Improvements (#10458) by discussing the long-term impacts of Logan expansion on the South Boston waterfront — an area slated to emerge as a wonderfully vibrant neighborhood over the next 30 years. The South Boston waterfront is geographically the most severely impacted area — a future pedestrian friendly environment now imperiled by the proposed tripling in capacity of Logan Runway 27.

South Boston Seaport District — A Gem in the path of Runway 27

150.1

Surprisingly, economic and environmental impacts on the South Boston Seaport District have not been presented by Massport. This tract of land, roughly 4-5 times larger than Boston's North End, is projected by the Boston Redevelopment Authority's recently published Public Realm Plan to emerge as a dense urban residential and commercial neighborhood over the next 30 years. Outdoor elements of the waterfront plan already under way include harborwalk, harbortrail (bike path), a Fan Pier outdoor skating rink, tidal pool and many harbor-based leisure activities. The Fan Pier buildout alone is projected at $20 billion — much of it made possible by public investment in infrastructure.

Taxpayers have invested $4 billion into Seaport District infrastructure and $4 billion into harbor cleanup, and should expect a long-term return on these investments. A large number of these taxpayers, including all of our members, have dedicated a personal effort in attending hundreds of various meetings with the City of Boston, the BRA, City Council, community leaders, the MBTA, the BTD, landowners, developers, towards achieving a successful master plan for the South Boston waterfront. At none of the hundreds of planning meetings attended by SAND core members — even with Massport, was a mention or consideration of an increase in flights departing from Runway 27. 150.1 (cont.)

Most unfortunately, the South Boston Seaport District is not yet inhabited by the tens of thousands of residents, workers and pedestrians projected in the BRA Master Plan, those most adversely affected by the tripling of capacity of runway 27 to 56,000 departures per year. We at SAND remain vigilant on behalf of our future neighbors.

The Massachusetts Visitors' Bureau and the Massachusetts Convention Center Authority contend that the proposed changes to the airport will aid the South Boston Seaport District by bringing in conventioneers. These cheerleaders for tourists and conventioneers are well-meaning, yet indefensible — the Boston Convention Center occupies a 60 acre parcel out of 800 acres of developable area. The Seaport District of South Boston has never been dedicated to the import and management of tourists, but rather to the service and livelihood of all denizens of the City. Furthermore, the impact of plane flights on the pedestrian environment evolving around the Convention Center (much to the benefit of conventioneers) has not been studied by the MCCA, nor do we expect pedestrian impacts to be provided your office in their comments on this EIS/EIR. 150.2

SAND continues to stress that the success of the South Boston Seaport District will be in its ability to evolve as a mixed-use district for living and working — not as a pedestrian-unfriendly environment with planes roaring 500 - 600 feet overhead. Massport — an agency that has squandered land-banking opportunities within its own Seaport District-based Marine Industrial Park for the sake of short-term revenue generation, is seemingly incognizant of the economic opportunities to benefit Massachusetts over decades to come.

Massport's systematic expansion of Logan Airport

Massport asserts that this proposal will reduce delays caused by wind patterns. Logically, one must ask why delays have been worsening over the past 10-15 years. Here, Massport does not contend that delays have increased as a result of wind patterns. Delays increase because Massport has systematically overburdened its runways. Massport's modus operandi for expansion has been to seek approval at a stated capacity, continue to exceed the capacity to a breaking point and then to state a new objective to alleviate its problems. 150.3

In fact, delays have worsened due to Massport's unwillingness to balance supply and demand for air travel. If passengers were able to fly for free, would Massport be expecting its airports to continue to meet demand?

We would suggest that delays would be reduced, now and in the future, by regulating supply and demand for air travel. Business and leisure travel has increased during the current economic boon and will certainly decrease as the economy stabilizes or if ticket prices are raised during peak periods. 150.4

Massport has not met reasonable Community Obligations

Although Massport is well aware of our community group (based in South Boston's historic Fort Point Channel neighorbood) Massport has not held a single meeting in this area for the benefit of property owners, residents, businesses. The Fort Point Channel neighborhood, home to the Childrens' Museum and New England's highest density population of artists and creative professionals, is the starting point and most significantly impacted neighborhood affected by Runway 27. 150.5

Flights pass over the Fort Point Channel neighborhood along A Street at altitudes of approximately 500-800 feet, yet no decibel or emissions testing has been performed in the Fort Point Channel area. 150.6

Massport's Concerted Campaign of Obfuscation

Massport's EIR and public relations campaign have been devoid of relevant information for the layperson to assess impact.

Massport has portrayed this EIR as

1) a delay reduction program
2) a plan to move air traffic over the harbor with a unidirectional runway
3) an economic necessity for Massachusetts

150.7

None of these portrayals are entirely truthful or substantiated by the EIR/EIS. Considering the potential for increased capacity at Logan with an additional runway (backed by precedent), this plan is much more than a delay reduction program. And considering the major *land-based* shifts in traffic on runways 22L, 22R and 27, the proposal is not a harbor move.

Although we accept that expansion at Logan would have a positive impact on the Massachusetts economy, we do not believe the positive benefit of this particular proposal outweighs its tangible burdens. Despite the vocal chorus of business leaders supporting the runway plan, none have embarked on providing an assessment of the long-term impacts to substantiate their position.

150.8

We at SAND expect a thorough economic assessment before we accept claims regarding substantial benefit.

As further evidence of Massport's attempt to obfuscate, the agency accepted and used the skewed results of a poll conducted by a business group to demonstrate an "invisible army" of support. In fact, questions offered by the telemarketing firm regarding the Logan proposal were misleading and directed towards supporting the plan.

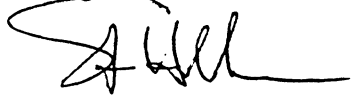
150.9

We ask the EOEA to either consider the actual questions asked by these telemarketers, or to discard Massport's use of biased polls and studies.

Finally, it is important to note that Massport worked with Governor Paul Cellucci during the EIS/EIR comment period, to secure Worcester Airport for future expansion. This type of knee-jerk planning is emblematic of Massport's roughshod approach to solving regional transportation issues.

In conclusion, SAND would suggest that Massport EIS/EIR 10458 is short-sighted, permanently retarding the progress of one of Boston's most notable long-term planning accomplishments — the South Boston Seaport District. This urban waterfront will evolve over many decades rather than in one or two business cycles, and the EOEA should join with SAND in appreciation of it — protecting an environment today that generations will enjoy tomorrow.

Best regards,



Steve Hollinger
on behalf of:
The Seaport Alliance for a Neighborhood Design (SAND)

Letter 150
The Seaport Alliance for a Neighborhood Design(SAND)
Steve Hollinger

Code	Topic 1	Topic 2	Comment	Response
150.1	Noise	Impacts	The South Boston waterfront is geographically the most severely impacted area...[T]he tens of thousands of residents, workers and pedestrians projected in the BRA Master Plan[are]...those most adversely affected by the tripling of capacity of Runway 27 to 56,000 departures per year.	Winthrop is actually the most severely affected by high noise exposure levels, now and in the future regardless of which alternative is implemented. However, the Preferred Alternative will provide some noise benefit to Winthrop, as well as to parts of East Boston and Revere that are also exposed to higher noise levels than South Boston.
150.2	Environmental Review Process	Public Process	...[T]he impact of plane flights on the pedestrian environment evolving around the Convention Center (much to the benefit of conventioneers) has not been studied by the MCCA, nor do we expect pedestrian impacts to be provided your office in...[MCCA's] comments on this EIS/EIR.	Comment noted.
150.3	Purpose and Need	Delay	Delays increase because Massport has systematically overburdened its runways. Massport's modus operandi for expansion has been to seek approval at a stated capacity, continue to exceed the capacity to a breaking point and then to state a new objective to alleviate its problems.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. Refer also refer to Section 4.2. The availability of Runway 14/32 is projected to produce a small improvement in air quality from improved efficiency of airfield operations.
150.4	Alternatives	Other Non-Construction Alternatives	We would suggest that delays would be reduced, now and in the future, by regulating supply and demand for air travel.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.

Code	Topic 1	Topic 2	Comment	Response
150.5	Environmental Review Process	Public Process	Massport has not held a single meeting in...[The Fort Point Channel] area for the benefit of property owners, residents, business.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.
150.6	Cumulative Impacts	Noise, Air Quality	...no decibel or emissions testing has been performed in the Fort Point Channel area.	Massport has a permanent noise monitor installed in South Boston at B and Bolton Streets not far from Fort Point Channel. It is referred to as Site 2 in numerous tables and in text throughout the document and is used as one of the 23 specific points at which many supplemental noise calculations are made.
150.7	Purpose and Need	Delay	Massport has portrayed this EIR as 1. a delay reduction program 2. a plan to move air traffic over the harbor with a unidirectionaly runway 3 an economic necessity for Massachusetts Considering the potential for increasing capacity at Logan with an additional runway.... this plan is much more than a delay reduction program. And considering the major *land-based* shifts in traffic on runway 22L, 22R and 27, the proposal is not a harbor move.	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway 14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.

Code	Topic 1	Topic 2	Comment	Response
150.8	Environmental Review Process	MEPA	Although we accept that expansion at Logan would have a positive impact on the Massachusetts economy, we do not believe the positive benefit of this particular proposal outweighs its tangible burdens. We at SAND expect a thorough economic assessment before we accept claims regarding substantial benefit.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
150.9	Environmental Review Process	Public Process	[Massport] accepted and used the skewed results of a poll conducted by a business group to demonstrate an "invisible army" of support...[Q]uestions offered by the telemarketing firm regarding the Logan proposal were misleading and directed toward supporting the plan. We ask the EOEA to either consider the actual questions asked by these telemarketers, or to discard Massport's use of biased polls and studies.	Comment noted.

LETTER 151

April 12, 1999

Secretary of Environmental Affairs
ATTN: NAPA Office
Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street, 20th Floor
Boston, MA 02205

Dear Mr. Secretary:

I would like to add my voice in support of the Logan Modernization project (including runway 14/32). 151.1

As I think a recent article in the *Boston Globe* amply demonstrated, the alternatives to Logan Modernization – including expansion of Hanscom Airport and other regional facilities – either are not viable or will not be sufficient by themselves. While I do not discount the importance of other transportation measures, such as expansion of airports in Worcester, New Bedford, Providence and Manchester and the introduction of a high-speed rail link to New York, I think that the continuation of improvements to Logan Airport is essential to the local economy. In the absence of such improvement, the problem of delays are bound to get worse. This would result in inconvenience to millions of air travelers in the Boston area, as well as the loss of millions of dollars to the local economy and the loss of opportunity for further jobs for the local workforce.

Very truly yours,

SHERBURNE, POWERS,
HOLLAND & KNIGHT

SLADE GORTON & CO., INC.
ROCKY BAY FISHING CO.

Finest and Widest Line of Seafood Anywhere"

LETTER 152

April 7, 1999

Mr. Arthur Pugsley EOEA No. 10458
Secretary of Environmental Affairs
MEPA Office
100 Cambridge Street 20th Floor
Boston, MA 02205

Dear Mr. Pugsley,

The Seafood Industry in New England has moved its product dependence from local fishing ports to Logan Airport for both receipt and shipment of fresh seafood. With the decline in fishing resources from local waters, fresh arrives instead from Chile, Iceland, Norway, Canada, etc. Therefore, the Logan Modernization project is critical for the economic well being of our businesses. The additional runway included in this project will allow more air-freight availability in and out of Boston, making importing and exporting of fresh fish quicker and more efficient. 152.1

Another benefit of this modernization is the improvement of the Roadway Interchange System currently being constructed by the Third Harbor Tunnel and the Central Artery projects. Reconfiguring the existing airport exit routes to a two-level roadway system will make the transport of cargo to and from the airport much easier and reduce traffic and congestion.

Of greatest importance to us is that the Logan Modernization project will help us with product availability and will keep Boston as the hub of the U.S. Seafood Industry. Slade Gorton will then be competitive in today's markets and into the 20th century.

If I can provide more information to you please contact me at 617-442-5800.

Sincerely,

Wally Stevens
President

LETTER 153

April 22, 1998

Bob Durand, Secretary
Executive Office of Environmental Affairs, Attention: MEPA Office
Arthur Pugsley, IV EOEA No. 10458
100 Cambridge Street - 20th floor
Boston, Ma 02202

Dear Secretary Durand,

The South Boston Environmental Health Watch is a group of residents that works with the support of the South Boston Health Center's Public Health Initiative to research and address environmental factors that threaten community health. We are particularly concerned with air quality as South Boston residents experience higher than expected rates of chronic obstructive respiratory diseases, cardiovascular disease, and some cancers including lung cancer. All of these diseases are worsened by air pollution.

Consequently, we are troubled by the Logan Airside Improvement Planning Project. Although the report proposes development at Logan to reduce aircraft delays, the premise of the entire report supports growth at Logan.. We are concerned that increased flights at Logan will translate to further degradation of air quality in the communities closest to Logan both from aircraft departures and takeoffs as well as from the associated ground traffic. 153.1

Massport claims that increased air traffic is needed to support local business, industry, and tourism. These needs will be increased as the Convention Center and Seaport District are developed. Our concern is that our community and other urban neighborhoods will bear the consequences of worsening air quality from increased road traffic bringing people and supplies to the Seaport District as well as from increased aircraft activity.

We, therefore, urge you to consider the cumulative effects of all sources of increased air quality degradation to the South Boston and other surrounding communities, already at high risk, that will be most impacted by growth at Logan.

Sincerely

153.1	Public Health	Effects	We are concerned that increased flights at Logan will translate to further degradation of air quality in the communities closest to Logan both from aircraft departures and takeoff as from the associated ground traffic.	The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.

Squantum Community Association
136 Standish Road
Squantum MA 02171

LETTER 154

April 7, 1999

State Representative Bruce Ayers
65 Williams Street
No. Quincy MA 02171

Dear Bruce:

The Squantum Community Association has many concerns regarding the proposed additional runway at Logan Airport.

1. The first concern is the Quality of Life in Squantum. Currently we are affected by the noise from the airport. It is, however, at the present time a concern, but due to previous negotiations it is a controlled effect. The evening flight paths do not bring flights over the Squantum area. The possibility of the increase of flights, especially over Squantum will also increase the noise level. 154.1

2. The discharge from the airplanes is a great concern to our residents. As flights increase so will the discharge and the potential for pollutants to fall from the sky. 154.2

3. The flight pattern that will increase any traffic over Moon Island is of serious concern to our residents. The planes will be at an altitude lower than the 1000 feet which is needed in order to maintain safety. A misfired bullet could hit the fuel tank of a low flying plane. Since these planes will have full fuel tanks, a disaster is sure to follow. 154.3

4. Very little has been done to prepare the South Shore and the Squantum Community for the impending runway. We feel that more information needs to be disseminated and more safety issues need to be addressed. 154.4

We look forward to hearing from you regarding all of the above issues.

Sincerely,

Frank Buckley

Frank Buckley
President,
Squantum Community Association.

Letter 154
Squantum Community Association
Frank Buckley, President

Code	Topic 1	Topic 2	Comment	Response
154.1	Noise	Impacts	The possibility of the increase of flights, especially over Squantum will also increase the noise level.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations.
154.2	Air Quality	Impacts	As flights increase so will the discharge and the potential for pollutants to fall from the sky.	Although VOC emissions increase over time because of increased aircraft operations activity at Logan Airport, emissions are lower with Alternatives 1 and the Preferred Alternative, when compared to the No Action Alternative. The decreases are attributable to both the proposed Runway 14/32 and the taxiway improvements.
154.3	Alternatives	Runway 14/32	The flight pattern that will increase any traffic over Moon Island is of serious concern to our residents. The planes will be at an altitude lower than the 1000 feet which is needed in order to maintain safety. A misfired bullet could hit the fuel tank of a low flying plane. Since these planes will have full fuel tanks, a disaster is sure to follow.	Runway 14/32 will reduce jet traffic over Moon Island from Runway 22 departures. It will increase the number of arrivals and departures over the harbor (Long Island, Rainsford Island, Gallops Island, Georges Island, etc.

Code	Topic 1	Topic 2	Comment	Response
154.4	Environmental Review Process	Public Process	Very little has been done to prepare the South Shore and the Squantum Community for the impending runway. We feel that more information needs to be disseminated and more safety issues need to be addressed.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. LETTER 155

BOSTON

April 6, 1999

Mr. Arthur Pugsley – EOEA No. 10458
Secretary of Environmental Affairs
Attention MEPA Office
100 Cambridge Street
20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

I am writing to convey some thoughts regarding the Logan Airport Modernization project and to give our support for the initiative that includes runway 14/32. 155.1

Swissôtel Boston is a 500 room deluxe hotel sited in downtown Boston serving the business and leisure communities not just from the United States but from around the world. A majority of our guests arrive by air, hence requiring the smooth operation of a state of the art world class efficient airport. Delays,often leading to cancellations,become a business hazard that need not be.

Our employee base is directly related to our occupancy and occupancy depends greatly on the airport.

Also, I believe that the success of our current convention center and the anticipated success of our future convention center rely heavily on a world class airport.

I hope your agency will do all in its powers to aid the Legislation for this worthy goal.

Sincerely,

David Gibbons
General Manager

LETTER 156

April 8, 1999

Mr. Arthur Pugsley
Secretary of Environmental Affairs
MEPA Office
100 Cambrdige Street, 20th flr.
Boston, MA 02205

Dear Mr. Pugsley,

RE: Logan Airport

156.1

I support another runway at Logan which would alleviate the delay problems. As a traveler, I have frequently circled eastern Mass. waiting to land; and as a resident of Milton, I often witness planes circling overhead at very low altitudes.

Commerce in Boston is a very important issue to me as a business person. Instead of using the old-fashioned, Yankee approach to public infrastructure of "patch and make do" with the attitude of "You can't get there from here," or "If you don't know the way, you don't belong here," why not move toward a user-friendly airport while simultaneously supporting regional airports and rail travel.

It's time for action.

Sincerely,

Charles K. Tufts, CLU, ChFC

U·S AIRWAYS

LETTER 157

Robert A. Hazel
Vice President
Properties and Facilities

April 8, 1999

Mr. Thomas J. Kinton, Jr.
Director of Aviation
Massachusetts Port Authority
One Harborside Drive, Suite 200S
East Boston, MA 02128-2909

Dear Mr. Kinton:

US Airways, which carries more Boston passengers than any other airline, strongly supports the development of a new 5,000 ft. runway and other airside improvements designed to reduce delays at Logan International Airport.

As you know, for many years, restricted airfield capacity at Logan has resulted in extensive delays for our Boston passengers. Because of the "unbalanced" nature of Logan's current airfield layout, the amount of useable runway capacity changes dramatically depending on the direction of the wind. As a result, not only does Boston rank sixth in delays in the U.S., but the occurrence and severity of those delays are particularly unpredictable.

In order for US Airways and other airlines to provide reliable and affordable air service, it is important that we be able to operate efficiently. Current airfield limitations at Logan do not permit efficient operations. The resulting delays are costly to the airlines and both costly and inconvenient for our passengers. 157.1

As with other major cities, Boston's future economic health will depend in part on having reliable air transportation links to national and international markets. Many other cities, including Atlanta, Miami, Philadelphia, San Francisco, and Seattle, are addressing this challenge by improving runway capacity. To remain competitive, Logan must move forward as well.

Sincerely,

Robert A. Hazel /cyp

April 12, 1999

Statement of the Winthrop Chamber of Commerce Regarding the Logan Airside Improvements Planning Project, Draft Environmental Impact Statement/Report of February, 1999.

The members of the Winthrop Chamber of Commerce recognize the economic value of Logan International Airport to this region. We also recognize the quality of life issues that face the residents of the Winthrop community. The health of the business community in Winthrop hinges on the quality of life present there. This Chamber cannot encourage any expansion that could create additional air or land traffic, additional noise, pollution, additional future operations, and/or other impacts. 158.1

We do in fact recognize the potential economic benefits to other areas of the Commonwealth and will support and encourage the development of regional airports, especially for but not limited to commuter flights. We feel that this would bolster the State's economy and would allow Logan the flexibility it needs to address the needs of both Boston as a world class city, and of Logan's neighboring communities. 158.2

Letter 158
Winthrop Chamber of Commerce

Code	Topic 1	Topic 2	Comment	Response
158.1	General Opposition		This Chamber cannot encourage any expansion that could create additional air or land traffic, additional noise, pollution, additional future operations, and/or other impacts	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates). Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
158.2	Regional Transportation	Regional Airports	We...encourage the development of regional airports, especially for but not limited to commuter flights. We feel that this would bolster the State's economy and would allow Logan the flexibility it needs to address the needs of both Boston as a world class city, and of Logan's neighboring communities.	Massport considers Logan Airport to be part of a regional system of airports that includes T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of the roles of Logan Airport and these regional airports in the eastern New England aviation system.

Arthur Pugsley
Secretary of Environmental Affairs
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202
Attn. MEPA Office

April 15, 1999

Dear Mr. Pugsley,

I am writing to express my strong opposition to the proposed opening of Runway 1432 at Logan Airport and to the unfair and misleading tactics that I believe Massport is using to gain public support for the runway.

How Runway 1432 will harm my neighborhood:

I have been a resident of the South End of Boston for many years. It is a wonderful and historic landmark district neighborhood -- the largest existing collection of Victorian-era brick row-house architecture left in the United States. Unfortunately, it is also in the direct flight path of a large number of flights taking off from Logan Airport.

Runway 1432 will allow Massport to significantly expand the number of flights using the airport and will significantly increase the number of jets flying directly over my neighborhood according to Massport projections.

The current level of noise in the neighborhood is an incredible burden to all of us here. The jets begin at 6:00 am. They often can still be heard until at least 11:00 pm, sometimes later. When Massport is using the runway that targets the South End, the noise is continuous. It wakes us up, it rattles our windows, it makes roofdecks and gardens un-useable. Watching TV or talking to friends is interrupted every few minutes as another jet takes off. As an RN in a pediatric hospital, I am also well aware of the dramatic rise in rates of asthma in children (and adults) and of the suggested links between asthma and poor air quality.

My neighborhood will be significantly harmed by the increased noise and pollution that will result if Massport is allowed to go forward with Runway 1432 plans. 159.1

How I believe Massport is using unfair and misleading tactics to gain support:

Last night, I saw a commercial on TV touting the purported benefits of Runway 1432. A toll free number was provided for those desiring more information. The commercial was distressing

in that it displayed Massport's apparent continued disdain and lack of concern for the neighborhoods which it impacts.

First, information was provided stating that the new runway would only be used for over-water take-offs, thus giving the false impression that Boston residents would not be adversely affected. No mention was made of the fact that the new runway's collateral effects would allow more intense use of the other existing runways, and would in fact, per Massport's own projections, double or even triple the number of flights over various neighborhoods in Boston. 159.2

In addition, when calling the toll free number, I was asked if I was aware that the new runway would reduce noise and air pollution over Boston. How can more-than-double the number of flights over my neighborhood decrease the noise and air pollution I am experiencing?

Finally, the commercial played on people's fears and frustrations related to the number of delays at Logan and the possible effect this could have on Boston tourism and business. In my opinion, these delays are overstated, as I understand Massport's statistics to include delays of less than 15 minutes (hardly a major inconvenience). Also, Massport did not point out that, while delays may be experienced, Logan Airport is one of very few airports in the country (world?) which can boast that it is located a mere 5 minute cab ride or 10 minute subway ride from the heart of the downtown business district. In most cities, you might always get in on time, but then you have an expensive, 45 minute ride to where you need to go. 159.3

Please consider what I have written. Please stop Runway 1432.

Sincerely,

Duane H. Andrews, RN

Code	Topic 1	Topic 2	Comment	Response
159.1	Noise	Impacts	My neighborhood will be significantly harmed by the increased noise and pollution that will result if Massport is allowed to go forward with Runway 14/32 plans.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
159.2	Environmental Review Process	Public Process	Massport's television ads give... the false impression that Boston would not be adversely affected. No mention was made of the fact that the new runway's collateral effects would allow more intense use of the other existing runways, and would in fact, per Massport's own projections, double or even triple the number of flights over various neighborhoods in Boston.	Massport did not sponsor television, radio, or newspaper advertisements. Projected changes in flight patterns and associated noise shifts are consistent with the PRAS goals, which were studied and approved by the community when established. Activity increases over certain communities are offset by activity reductions over other severely impacted communities and by activity increases over water.

Code	Topic 1	Topic 2	Comment	Response
159.3	Delay	Model	Massport overstates the levels of delay that occur at Logan.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.

LETTER 160

40 Union Park
Boston, MA 02118
April 12, 1999

Mr. John Rodman, Assistant Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

Subject: New Runway at Logan Airport

Dear Mr. Rodman:

I'm sending you this written testimony since I was unable to attend the public hearings last week.

The South End section of Boston is adversely affected by airplane noise. I have lived here over seven years and this year the noise level has increased dramatically. It starts at 6 am with a plane flying low overhead every minute, and it continues all day and part of the night.

If the new runway is built the number of flights over the South End and Roxbury will triple in ten years. Life here will become unbearable. The South End is a landmark district with just as much historic value as Concord and Uxbridge. It is an area that is undergoing an economic rebirth. Similarly, the Washington Street "Main Street" and Roxbury are both being redeveloped. But running a stream of low flying planes over these areas is going to ruin the quality of life in our neighborhoods, and damage property values as well. 160.1

Eventually the new runway will permit Massport to increase air traffic levels over ALL areas of the city. It is time to put a stop to this continual expansion, especially since Massport has no clear plan for the future. Alternative forms of transportation (especially trains) need to be developed and other airports promoted in order to keep Logan from growing like a cancer and destroying the city. 160.2

I ask the MEPA to not approve the new runway at Logan Airport.

Sincerely,

John Archibald

160.1	Noise	Impacts	...Washington Street "Main Street" and Roxbury are both being redeveloped. But running a stream of low flying planes over these areas is going to ruin the quality of life in our neighborhoods, and damage property values as well.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
160.2	Regional Transportation	Passenger Rail/Regional Airports	Alternatives forms of transportation (especially trains) need to be developed and other airports promoted in order to keep Logan from growing like a cancer and destroying the city.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

March 30, 1999

LETTER 161

Governor Paul Cellucci
The State House
Office of the Governor, Room 360
Boston, MA 02133

Dear Governor Cellucci,

Massport's proposal to build Runway 14/32 is a slap in the face of all of Boston's neighborhoods and citizens. This runway will add capacity and inflict heavy noise on the majority of the city's inner neighborhoods, including East Boston, Charlestown, South Boston, Beacon Hill, Back Bay, Roxbury, Jamaica Plain as well as our own South End community.

For the past nineteen years, we have lived and raised our family in the South End, committed to the many benefits of being part of a diverse, caring inner city community. Over the last several years, our neighborhood has increasingly been on the flight path, which sends ear-deafening jets every couple of minutes over our home. As it currently stands, pilots often do not obey the noise abatement "corridor", and I was at a recent meeting where Massport and the FAA admitted that there is no way to enforce this corridor. If Runway 14/32 goes through, that traffic, and the noise pollution associated with it, will triple. 161.1

Massport claims that Runway 14/32 will help reduce delays at Logan. Yet they also admit that the proposed runway is a short-term solution, and that delays will return to their current levels by 2005, while the increase in noise pollution will be with us, the people of the City of Boston, forever. What, we ask, will be proposed in 2005?

It appears that Massport seeks to pit the Boston communities against each other, yet clearly this is a regional problem that demands regional solutions. Massport and the State Administration must look seriously at better utilizing existing airports in Providence, Worcester and Manchester, as well as Hanscom Field. Clearly, Boston needs a viable secondary airport that many American cities enjoy.

A long-time South Ender recently remarked "If there was ever a time for the people of Boston to stand up and shout, then this is that moment". As our Governor, you are in a position to help Boston's neighborhoods by opposing Runway 14/32. We hope that we, the people of Boston, can count on you.

Sincerely,

David A. Banta

LETTER 162

David Bartol
15 Dartmouth Place #3
Boston, MA 02116
February 16, 1999

MEPA Office
100 Cambridge Street
Boston, MA 02202

Dear Sir or Madam,

I have lived in the South End of Boston for about 10 years and find that the current noise from Logan Airport is a serious problem. In the summer when my windows are customarily open, it's sometimes impossible to hear an indoor conversation because of the airline noise! I have to sleep with a fan or air conditioner running when otherwise unnecessary, so as to provide "white noise" to drown-out the cacophonous noise from the jets overhead. And this is just the problem experienced indoors! Outdoors, it's even more disturbing. The existing situation is bad enough and I suppose I am resigned to it; however, the proposal to create a new runway, "14-32" is completely unacceptable.

I ask you to take whatever action possible to permanently stop the construction of runway 14-32! 162.1
Thank you for your attention and efforts.

Yours Truly,

David Bartol

Boston, MA 02115

LETTER 163

Arthur Pugsley
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202
ATTN: MEPA Office

Subject: Logan's expansion plans; EIS

Boston, April 20th 1999

Dear Arthur Pugsley,

Enclosed you can find the letter my husband and I sent a couple of weeks ago to the most important politicians and representatives of Massachusetts with regard to Logan's expansion plans and Massport's Environmental Impact Statement (EIS).

In addition to this letter I would like to mention following:

LOGAN'S IMPACT ON BOSTON:
* also Back Bay and Beacon Hill are already impacted of the noise caused by the use of Runway 27. An additional runway 14/32 will make it even worse !
* in Boston most planes do neither fly in the dictated flight height nor flight path
* the last couple of month the planes pass between 6.00 and 8.30 am approximately every 30 seconds the South End/Back Bay neighborhood

FAILINGS of MASSPORT'S NOISE ABATEMENT OFFICE:
* the last couple of weeks I have called the Logan's Noise Complaint Line again and again. Either I received different answers for the same questions and complaints or I haven't received my complaint report or nobody answered the phone
* until now I haven't received my requested personal copy of the EIS
* answers like "an airport is a bearable burden" are not acceptable !
* I also tried to get in contact with the acting Manager of Noise Abatement, Nancy Timmermann. She never returned my call (voice mail message)

BOSTON'S INTERNATIONAL APPROACH or what describes a world class city?:
* in most civilizedcountries planes are not allowed to fly over a highly populated area
* most countries have a night flight stop
* in most countries airports have been moved outside of the cities

These statements make clear that further expansion plans of Logan Airport are not acceptable. Boston's quality of life and reputation as a world class city will definitely suffer under a new runway.

I ask you to do all in your power to stop the construction of Runway 14/32. Massport also needs to investigate other equitable solutions for Runway 27. Vibrant, healthy communities are a major factor in Boston's reputation as a world class, people friendly area. Please do not allow Massport to destroy what the Bostonians have worked so hard to achieve.

Sincerely,

Claudia Brede

Senator Edward M. Kennedy
Senator John F. Kerry
Congressman John Joseph Moakley
Congressman Michael Capuano
Senator Dianne Wilkerson
Senator Stephen F. Lynch
Representative Byron Rushing
Representative Gloria L. Fox
Representative Salvatore F. DiMasi
Governor Paul Cellucci
Mayor Thomas M. Menino
Councilor James M. Kelly
Councilor Thomas Keane

March 1999

Dear:

In 1997 my husband and I bought a Penthouse condominium next to the South-West Corridor. Until June 1998 we lived here in a peaceful and relatively quiet neighborhood, but since then we suffer from increasing noise generated by airplanes departing Logan Airport on Runway 27. This is has reached a level, that now even our 22month old daughter (normally a good and long sleeper) wakes up every morning between 6.00 and 7.00 am.

We understand that the Massachusetts Port Authority ("Massport") has recently filed for the environmental permits required to open a new runway, Runway 14/32, which they claim is needed to reduce delays at the airport. A byproduct of this delay reduction will be a 300% increase in airplane traffic over our home, bringing with it increased noise and air pollution. Not to forget the possible damage to the very old buildings due to shaking vibration and sound waves. Not to mention the disastrous consequences, if a plane crashes in to our neighborhood. 163.1

In our opinion this is a short sighted solution to the delay problems at Logan. Massport's own analysis reveals that delays will return to current levels with five years of construction runway 14/32, and their claim of improved "spreading" of the noise associated with a 4% annual growth rate can not be substantiated. Indeed, the FAA tower has re-fused to be held to any agreement concerning noise abatement or mitigation measures.

As the noise levels are already unacceptable, any increase will cause a serious deterioration in the quality of life in our neighborhood as well as in a decrease of the value of our homes. 163.2

We ask you to do all in your power to stop the construction of Runway 14/32. Massport needs to investigate alternatives such as peak hour pricing and the use of regional airports, such as Massport owned Hansom Airport in Bedford, before adding to our burden. 163.3 163.4

Vibrant, healthy communities are a major factor in Boston's reputation as a world class, people friendly area. Please do not allow Massport to destroy what the Bostonians have worked so hard to achieve.

Sincerely,

Claudia Brede

163.1	Alternatives	Runway 14/32	...Runway 14/32 will cause... a 300% increase in airplane traffic over our home, bringing with it increased noise and air pollution. Not to forget the possible damage to the very old buildings due to shaking vibration and sound waves. Not to mention the disastrous consequences, if a plane crashes in to our neighborhood.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
163.2	Noise	Impacts	As the noise levels are already unacceptable, any increase will cause a serious deterioration in the quality of life in our neighborhood as well as in a decrease of the value of our homes.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
163.3	Alternatives	Peak Period Pricing	Massport needs to investigate alternatives such as peak hour pricing .	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
163.4	Regional Transportation	Regional Airports	Massport needs to investigate alternatives such as the use of regional airports, such as Massport owned Hansom Airport in Bedford, before adding to our burden.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

LETTER 164

4/20/99

Arthur Puglsley
Executive office of Environmental Affairs
100 Cambridge Street
Boston MA 02202
Attn: MEPA office

I live on the street level of an apartment in Boston's South End. In fact, my bedroom is yards away from Shawmut Avenue. On most weekends, I am awakened early, around 6 AM. The noise doesn't come from the sound of automobile traffic. Nor is it car radios, pedestrians walking by, sirens, or trucks that cause me to wake up. Instead, it is planes from nearby Logan airport. From 6 AM and lasting all day, these planes cause so much noise, that the peace and tranquility of a weekend in the South End is ruined. Even having a conversation with someone within earshot becomes a shouting match.

Now, Massport, and Gov. Celluci, want Logan to expand to accommodate more air traffic, thus causing more noise and pollution over nearby communities and forever destroying any semblance of quiet within our neighborhood.

Since moving here in 1996, I observed how little long term planning has gone into Boston's future. The most obvious examples of planning gone awry to this outsider include the ugly and obsolete Central Artery; the just plain ugly City Hall; and the badly located Logan Airport. Now, instead of addressing the real problem - that Logan is also becoming obsolete and should be relocated - Massport and Celluci want to throw a Band-Aid on this noisy, festering wound. Allowing air traffic to increase will be a sonic nightmare for the area residents. If South End residents don't like the noise now, it's certainly not going to improve once Logan expands and installs a new runway. Unlike Mayor Menino, the short sighted Celluci wants to appease the business and tourist trade with solutions that remedy the symptoms not actually solve the long-term problems. As South End residents, we will suffer more. 164.1

Certainly, the Big Dig, as unattractive as it is, is a step in the right direction, "righting the wrongs" of past bad planning in a way. Perhaps Massport could take a cue from the badly planned past and help create a more livable future instead of trying to 'soft sell" us with TV advertising or steamrolling runway expansion through the legislature. By proposing a new out-of-town airport, Massport and Celluci would show that they have the progressive ideas that were sorely lacking from past politicians and planners. This means having courage and risking one's political career to effectively *plan.*

Code	Topic 1	Topic 2	Comment	Response
164.1	Noise	Impacts	If South End residents don't like the noise now, it's certainly not going to improve once Logan expands and installs a new runway.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.

LETTER 165

April 20, 1999

Mr. Arthur Pugsley
Attn: MEPA Office
Executive Office of Environmental Affairs
100 Cambridge St.
Boston,
MA 02202

Re: Proposed Expansion of Logan Airport

Dear Mr. Pugsley:

I am writing to oppose the Massport proposal for an additional runway at Logan Airport. I believe this proposal is based on a flawed strategy for improving airport service, it increases pollution in neighboring communities that are subjected to a disproportionate environmental burden already, and results from an unwillingness by Massport to acknowledge or remedy the adverse impact Logan has on the surrounding community.

I understand the rationale for airport expansion is based on the anticipation of increased air traffic in the eastern Massachusetts, and the fact that Logan experiences significant delays in service. At the same time, Massport has indicated new runway is only a short-term remedy. I believe the following issues need to be addressed prior to approval:

- Massport must present a master plan for comprehensive review. It is ridiculous to approve airport expansion on a case-by-case basis. Massport claims that the new runway will only be unidirectional. Is this restricted use embedded in the long-term plan, or is the unidirectionality of the runway a temporary condition? **MEPA must demand a full review of Massport's long-term airport expansion strategy.** 165.1 165.2

- It is evident that Massport has not made a serious effort to use facilities effectively. For example, it has not instituted a peak-pricing structure to shift traffic to off-peak times. Surrounding airports are operated far below capacity. Massport dismisses alternatives to expansion as "unworkable", which only suggests they cannot be trusted to implement remedies that would render expansion unnecessary. **MEPA must require Massport to exhaust all reasonable alternatives prior to the approval of Logan expansion.** 165.3

- This short-term Massport expansion anticipates increases air traffic at Logan. Thus, Massport proposes to increase pollution in neighboring communities. I oppose this additional pollution for personal reasons. I live under Logan flights and suffer from frequent loud jet engine noise. I shudder to imagine what tripling the frequency of

flights will do. **MEPA must cap, at the current level, the amount of noise, and other relevant pollutants, created by Logan activities**. Thus, Logan could expand as technological advances in pollution/noise reduction are implemented by airlines. 165.4

- It is important to review the history of the relations between Massport and the community. Massport has a history of broken promises with its neighbors. Of relevance is that fact that covenants exist in the Big Dig/Third Harbor Tunnel agreement that will be contravened by implementing this Massport proposal. Thus, Massport will discard its own recent agreement because it is expedient. **For this reason, MEPA must apply a higher standard for permit approval for entities such as Massport with a poor record of compliance or community relations.** 165.5

I hope my comments will be granted serious consideration. On a personal note, I am disgusted that Massport would offer this proposal without giving any opportunity for honest community input. This proposal anticipates an extremely negative impact on the quality of life of Logan's neighbors. Massport doesn't even care. I hope that you will.

Cordially,

Barry B. Corden

165.1	Alternatives	Runway 14/32	Massport claims that the new runway will only be unidirectional. Is this restricted use embedded in the long-term plan, or is the unidirectionality of the runway a temporary condition?	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
165.2	Alternatives	Preferred Alternatives	MEPA should demand a full review of Massport's long-term airport expansion strategy.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
165.3	Environmental Review Process	MEPA	MEPA should require Massport to exhaust all reasonable alternatives prior to the approval of Logan expansion	Refer to response to Comment 165.2.
165.4	Environmental Review Process	MEPA	MEPA must cap, at the current level, the amount of noise, and other relevant pollutants, created by Logan activities. Thus, Logan could expand as technological advances in pollution/noise reduction are implemented by airlines	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.
165.5	Environmental Review Process	MEPA	MEPA must apply a higher standard for permit approval for entities such as Massport with a poor record of compliance or community relations.	Comment noted.

I thought Fred Salvucci and I had buried the plan for a new runway at Logan Airport forever back in the 1980s.

Unfortunately, like the Phoenix, it's back-- and this time it makes even less sense that it did ten years ago.

Why? Because it is a very short term solution to what is a long term problem that won't be solved by putting another runway in Boston Harbor. That problem can be solved by using three important tools that are now available to us. 166.1 166.2

The first is Amtrak's new high speed Acela express service that begins this fall-- ten trains a day between Boston and Washington that will carry thousands of former shuttle sufferers quickly and easily from Boston to New York in three hours, downtown to downtown. No more metal detectors. No more fuming at delays in the airport and on the runway. No more thirty dollar, one hour cab rides from LaGuardia into downtown New York.

And if you happen to live west, south or north of Boston, you can forget about fighting your way through the tunnels to Logan and a sixteen

dollar a day parking tab. A new Amtrak station with two thousand parking spaces will be waiting for you at Route 128.

The second is not one, not two, but three regional airports, each located close to an older urban community that wants and needs growth. 166.3 Manchester, Worcester and Providence are all conveniently located within easy driving or rail commuting distance of thousands of Logan users who can be better served by these airports. Providence is already connected to Boston by road and rail, and a new station stop at Green Airport will be just minutes by a moving sidewalk from the terminal. The Massachusetts Turnpike Authority should get cracking on a spur from the turnpike to the Worcester Airport, which is just a few minutes shuttle ride from the magnificently restored Worcester railroad station. New Hampshire already plans to build a new highway connection to the Manchester Airport, and it wouldn't take much to extend existing commuter rail lines there as well.

Finally, some simple management steps at Logan would open up even more capacity for the longer flights that Logan is uniquely equipped to provide. We tried one-- peak pricing-- in the 1980's with spectacular 166.4 success. In fact, Logan went almost overnight from 18th to 2nd among the nation's major airports in on-time performance. Unfortunately, the small

plane lobby went to work on the Reagan Administration, and we were ordered to revoke our landing fee plan. But there is absolutely no reason why small puddle jumpers should be taking up valuable airspace during some of Logan's busiest hours. Peak pricing requires them to adjust around those hours, and there are plenty of smaller airports in addition to Manchester, Worcester, and Providence that can accommodate them as well.

Mayor Menino had the good sense to call for a blue ribbon commission on the subject. I have what I think might be an even better idea. Governor Cellucci should call a summit meeting of his fellow governors from New Hampshire and Rhode Island and the mayors of the four key cities that are involved. They should each bring their top transportation planners with them. Stan Bagley, a Massachusetts native and the very capable chief of Amtrak's Northeast division, should join them. In a matter of months they could put together a plan that would dwarf the piddling contribution that a new runway would make to the problem. 166.5

Then we could bury this misbegotten proposal once and for all with appropriate ceremonies and pronounce a final benediction over it.

Rest in peace.

Letter 166

Code	Topic 1	Topic 2	Comment	Response
166.1	Alternatives	Preferred Alternative	... it is a very short term solution to what is a long term problem ...	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
166.2	Regional Transportation	Passenger Rail	... problem can be solved by using three important tools that are now available to us. The first is Amtrak's new high speed Acela express service...	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market.
166.3	Regional Transportation	Regional Airports	The second is not one, not two, but three regional airports ... Manchester, Worcester and Providence...	Since 1990, there have been several studies that have recommended regional initiatives to improve the efficiency of the region's inter-city transportation network. These studies reflect the cooperation of federal, state and local transportation agencies and stakeholders. Section 2.1 of the Supplemental DEIS/FEIR summarizes relevant regional planning studies and their conclusions. All studies have concluded that the Proposed Runway 14/32 and the other airside improvement projects at Logan Airport, along with increased use of the regional airports, including T.F. Green/Providence, Manchester and Worcester Regional airports, and high-speed rail services, are all necessary for accommodating the region's future inter-city air travel demand. Refer to discussion of the role of regional alternatives and steps Massport has taken to foster increased use of these alternatives in Chapter 2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
166.4	Alternatives	Peak Period Pricing	Some simple management steps at Logan would open up even more capacity for the longer flights that Logan is uniquely equipped to provide. We tried one—peak pricing—in the 1980's with spectacular success. In fact, Logan went almost overnight from18th to 2nd among the nation's major airports in on-time performance. Unfortunately, the small plane lobby went to work on the Reagan Administration, and we were ordered to revoke our landing fee plan.	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
166.5	Environmental Review Process	Blue Ribbon Panel	Governor Cellucci should call a summit meeting of his fellow governors from New Hampshire and Rhode Island and the mayors of the four key cities that are involved. ... In a matter of months they could put together a plan that would dwarf the piddling contribution that a new runway would make to the problem.	In November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.

LETTER 167

Thursday, 22 April, 1999

Mr. Arthur Pugsley
Executive Office of Environmental Affairs
100 Cambridge Street
Boston MA 02202

Dear Mr. Pugsley,

As a resident of Boston's South End for more than 25 years, I must register my strong opposition to the Massport runway expansion plan. I am not qualified to speak for other sections of the city, but I believe I can accurately state that the plan will negatively affect the quality of life in the South End, Roxbury, and Jamaica Plain so severely as to undo much of the growth and economic gain accomplished in the recent past.

I live approximately three miles from the end of runway 27. Although my house is more than ½ mile from the center of the designated takeoff path, airplanes take off directly over my house frequently. At their worst, a not uncommon occurrence unfortunately, planes take off every 45 seconds. Peak noise levels in excess of 90 db are common, and I have personally measured many planes with peak sound levels in excess of 105 db. The roar of jet planes is particularly onerous. The roar of an individual plane can often be heard for two minutes (with additional reinforcement every 45 seconds!). When airplanes are flying overhead it is virtually impossible to sleep, carry on conversation, or even watch TV. Six A.M. is a busy time, so morning sleep is out of the question. If runway 27 is also in use the previous evening, airplanes will take off until midnight, and occasionally even later, limiting the total number of hours of sleep to six or less.

Massport acknowledges that the runway plan will triple the number of airplanes passing over our houses, which is itself well beyond acceptability, but I have good reason to believe that the noise effects will more than triple. In my experience and measurements made over the years, small planes do not generate either the level of noise nor the pervasive roaring type of noise created by the larger jets. If the smaller planes are diverted to the new runway and the number of planes over our neighborhood tripled, the noise increase will far exceed the level of noise suggested by Massport. The number of nights for which more than six hours of sleep is possible will obviously decline substantially.

167.1

Massport has clearly pulled out all of their guns to win approval for the expansion plan. After being chastised for attempting to spend public money on advertising, it has persuaded business leaders to finance full page ads in favor of its plan. It has attempted to pit neighborhood groups against each other, and it has attempted to paint those opposed to the expansion as anti-business. I am hardly anti-business: I teach in a business department at Bentley College, and consult to business. I understand the need for efficient airport access and operation. However, that need must not be allowed to take absolute precedence over a reasonable quality of life for the citizens of Boston. 167.2

There have been many days in which the airplane noise has tempted me to give up the many years of effort I put into building my home and improving my neighborhood. If the noise increases even as much as Massport admits, I fear that I will no longer be able to remain in my home. Many of my neighbors have expressed the same opinion: that, with great reluctance, they will find it necessary to abandon the city in favor of sleep and quality of life.

This situation must be weighed fairly in tradeoff with the needs of business and other travelers to Boston. With the political climate strongly in favor of Massport, it seems that the state Office of Environmental Affairs and the U.S. Environmental Protection Agency are the only ones who are in a position to protect the interests of the citizens of Boston, and that the intense noise pollution proposed with its accompanying deterioration of the quality of life is a serious and reasonable concern to be addressed by these offices.

As a footnote, I might add that it is difficult for me not to be skeptical of any claims or promises that Massport makes. After working on a committee of FAA, Massport representatives, commercial pilots, scientific analysts, and citizens for ten years to establish a reasonable takeoff pattern for runway 27, airplanes using runway 27 still do not adhere to the runway pattern developed. Although Massport claims that the pilots are unable to fly the pattern accurately, commercial pilots that I have met have told me that the pattern is perfectly reasonable, but that the control tower makes virtually no effort to enforce the pattern. Use of the developed pattern would provide substantial noise relief for the community, but Massport appears to have little concern for anything but its own interests; its promises ring hollow to me. 167.3

Sincerely yours,

Irv Englander

167.1	Noise	Impacts	Massport acknowledges that the runway plan will triple the number of airplanes passing over... [The South End] which is itself well beyond acceptability, but I have good reason to believe that the noise effects will more than triple. In my experience and measurements made over the years, small planes do not generate either the level of noise nor the pervasive roaring type of noise created by the larger jets. If the smaller planes are diverted to the new runway and the number of planes over... [The South End] tripled, the noise increase will far exceed the level of noise suggested by Massport.	Massport and the FAA stand by the estimates in this document.
167.2	Purpose and Need	Delay	I understand the need for efficient airport access and operation. However, that need must not be allowed to take absolute precedence over a reasonable quality of life for citizens of Boston.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
167.3	Noise	Runway Use	Although Massport claims that the pilots are unable to fly the [Runway 27] pattern accurately, commercial pilots that I have met have told me that the pattern is perfectly reasonable, but that the control tower makes virtually no effort to enforce the pattern. Use of the developed pattern would provide substantial noise relief for the community.	Since the new departure procedure was implemented in accordance with the *Runway 27 EIS*, Massport and the FAA have been monitoring and analyzing aircraft flight track data for compliance and to determine the need for changes to achieve the objectives. Pilots are responsible for knowing and complying with noise abatement procedures unless otherwise instructed. As more aircraft are equipped with GPS navigation, compliance should improve.

LETTER 168

March 23, 1999

Bob Durand, Secretary
EOEA, Attn: MEPA Office
Arthur Pugsley, EOEA #10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

RE: Draft Logan Airside Improvements (a/k/a Runway 14/32) EOEA #10458

Dear Mr. Durand:

1. I am **OPPOSED** to Runway 14/32 as any benefits of same are strongly outweighed by the resulting adverse health, environmental, and economic costs on myself, my neighbors and other metropolitan area residents. 168.1

2. As a homeowner residing adjacent to Franklin Park, I am already negatively impacted by Logan Airport's overflights resulting in loss of sleep, irritability, loss of use/enjoyment of my yard and garden, concerns re pollutants and health impacts, and diminishment of enjoyment of public spaces such as Franklin Park and the Arnold Arboretum.

3. Runway 14/32 will further increase the adverse health, environmental, economic, and quality of life impacts on myself and my neighbors from these overflights. It will also negatively impact area children's health and learning as the planes are clearly audible within, for example, English High School where I attended Massport's informational meeting on this matter. 168.2

4. Massport should be required to withdraw this proposal and perform a comprehensive study, including, analysis of the health, environmental, and economic costs on the affected communities, using current data, and including maximum utilization of other pre-existing regional airfields. 168.3

Code	Topic 1	Topic 2	Comment	Response
168.1	Alternatives	Runway 14/32	I am opposed to Runway 14/32 as any benefit of same are strongly outweighed by the resulting adverse health, environmental, and economic costs....	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
168.2	Alternatives	Runway 14/32	Runway 14/32 will further increase the adverse health, environmental, economic, and quality of life impacts.....	Refer to response to Comment 168.1. Refer to Chapter 6 of the Supplemental Draft EIS/FEIR for a discussion of environmental impacts of the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
168.3	Environmental Review Process	MEPA	Massport should be required to withdraw this proposal and perform a comprehensive study, including, analysis of the health, environmental, and economic costs on the affected communities, using current data, and including maximum utilization of other pre-existing regional airfields.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 169

Arthur Pugsley
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 0--2202
Attn: MEPA Office

April 20, 1999

Dear Mr. Pugsley,

I'm writing to register my opposition to Massport's Runway 14/32 (airport expansion) project. What concerns me most is how this will impact the city I love so much. The size of this city is what drew me here from New York. With an increase in air traffic we will loose the very thing that makes this city so livable. And all this for convention attendees who don't even live here? Who barely leave their hotel? Let them go to NYC if they want a crowded, dirty, noisy location for their meeting. If they want a walkable, livable city to enjoy during their stay then they will come here and put up with a few delays (but as you know there are delays at the largest airports). 169.1

I would secondly oppose the project because it could triple the number of flights over the South End which not only is my home but is one of the most desirable neighborhoods in Boston. Increased flights will most definitely have an impact on this, and the general quality of life we enjoy here in this city. Personally, I'm willing to give up any financial gain in order to maintain the quality of life I enjoy here. 169.2

Boston's advantage is it's manageable size, The fact that one can walk around easily and actually "experience" the city while you are visiting - even if only for a short time. We offer water, shopping, history, gardens and architecture all within a short distance; in a city that seems the size of a large village....and we need to preserve this.

I hope for your support on this matter,
Sincerely,

Nina Garfinkle

LETTER 170

Attached please find my comments on the Massachusetts Port Authority's Draft Environmental Impact Statement on its airside Improvements Planning Project. I would ask that you reject their proposal.

LETTER 170

61 RUTLAND STREET
BOSTON, MA 02118

April 22, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge St.
Boston, MA 02202
Att: MEPA Office/Arthur Pugsley

Dear Secretary Durand:

I am writing to give my comments on the Massachusetts Port Authority's Logan Airport Airside Improvements Planning Project Draft Environment Impact Statement.

I am a 34 year resident of the South End of Boston, directly under the flight path of Runway 27, which is slated to see an increase of as much as three times the current air traffic under which we suffer today. The neighborhood in which I live is a multi-ethnic, multi-economic and multi-generational one.

It is my strong feeling that Massport's DEIS does not make a credible case for its project and should be rejected for the following reasons:

1. **It will impose an unacceptable noise burden upon my community without any commensurate benefit either to Logan Airport or to the citizens of the Commonwealth.** The EIS, as I read it, argues a narrow case for construction of a new runway and taxiway without examining in appropriate detail how these construction projects will adversely affect the surrounding impacted communities. The EIS similarly fails to evaluate the effect of the increased demand which will be generated by the proposed construction project on its terminal facilities, baggage handling, parking capacity, public transportation and road access at the airport. 170.1

2. **The project, by Massport's own account in the DEIS, will generate, at best, limited, dubious and short term benefits for the traveling public while imposing onerous and permanent noise and pollution burdens on Massport's neighbors.**

3. **Massport has failed to perform any outreach to impacted non-English-speaking Latino residents in my community.** There is a large community here, several thousand residents in the development of Inquilinos Boricuas En Accion, who will be severely and adversely impacted by this proposed runway construction project. Several hundred more are low-income tenants of the Boston Housing Authority. Massport's failure to attempt any 170.2

education of the non-English speaking population, coupled with their refusal to meet with other members of the South End community seems in direct violation of the standards set forth in President Clinton's Environmental Justice Executive Order promulgated early in his administration.

4. **Massport's paid advertising campaign, during the public comment period, is an outrageous violation of the spirit of the environmental laws with which Massport has to comply in order to receive approval for this project.** That it would engage in such a blatant attempt to influence the environmental process by purveying false and misleading information about the purposes and results of this complex project should, in itself, be viewed as grounds to reject the DEIS. If left to stand, it will make a mockery of the environmental process itself. Many more people will have heard the false claims in the TV and radio advertising than will have had access to the Environmental Impact Statement. That Massport refused to hold educational meetings in many communities and failed to provide any information in the Spanish language while engaging in deceptive advertising should be severely sanctioned. The appropriate sanction is requiring withdrawal of the DEIS. In no event should Massport, or a group calling itself Citizens for Efficient Regional Transportation, be allowed to submit to MEPA any results from an alleged "survey" being conducted in conjunction with this campaign. The "survey" is completely biased and uses invalid polling methods to come up with a result predestined to favor the project. 170.3

5. **Massport's assertions about delay are questionable at best.** The Citizens Advisory Committee to Massport (CAC) has determined that Massport failed to use readily available data on delay from the FAA to support its representations about the severity of the problem at Logan. My community's representative on that body has convinced me that there is no basis for Massport's assertions about the new runway as a tool for delay reduction at the airport. To the contrary, it appears that the delay situation will worsen within 5 years or less while Logan will have subjected its neighbors to an environmental nightmare of noise and pollution. At the least, the DEIS should be withdrawn and Massport should be required to compute actual delay data for Logan airport. 170.4

6. **The EIS makes short shrift of logical solutions to congestion and delay at the airport such as Peak Hour Pricing and regional alternatives such as Massport-owned Hanscom Field.** 170.5 170.6

In short, *Massport's Draft Environmental Impact Statement is fatally deficient. It should be rejected or withdrawn from consideration by the EOEA. A new study should be required based on a broader scope and a higher standard for community education and input.* Thank you for your consideration.

Very truly yours.

Code	Topic 1	Topic 2	Comment	Response
170.1	Alternatives	Preferred Alternatives	It will impose an unacceptable noise burden upon my community without any commensurate benefit either to Logan Airport or to the citizens of the Commonwealth.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-7 of the Supplemental DEIS/FEIR.
170.2	Environmental Justice	Impacts	Massport has failed to perform any outreach to impacted non-English-speaking Latino residents in my community.	Massport has involved the Hispanic community in public review of the Airside Project. Copies of the Airside Project Draft EIS/EIR were distributed to the Chelsea Human Services Collaborative, the Centro Hispano de Chelsea, and the Chelsea Commission on Hispanic Affairs. Consistent with FAA policy of providing translation on request, a Spanish-language interpreter was present at a meeting on February 23, 1999 with the Latin American Planning and Development Group. Massport also held a public hearing on March 3, 1999 with the Chelsea City Council at which over one hundred citizens had the opportunity to provide comment to Massport officials following a presentation of the Proposed Project.
170.3	Environmental Review Process	Public Process	Massport's paid advertising campaign, during the public comment period, is an outrageous violation of the spirit of the environmental laws with which Massport has to comply in order to receive approval for this project.	Massport did not sponsor television, radio, or newspaper advertisements for the Airside Project. Since the initial scoping, FAA and Massport have established a dialogue with the Airside Review Committee (ARC), community leaders and the public through hearings, briefings, and circulation of over 700 copies of the *DEIS/EIR* for comment. At public meetings and at the request of interested community members, Massport has provided the public access to information about the Airside Project and its associated social and environmental effects. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the *DEIS/EIR*, the FAA held two public hearings.

Code	Topic 1	Topic 2	Comment	Response
170.4	Delay	Model	Massport's assertions about delay are questionable at best.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
170.5	Alternatives	Peak Period Pricing	The EIS makes short shrift of logical solutions to congestion and delay at the airport such as Peak Hour Pricing.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
170.6	Regional Transportation	Regional Airports	The EIS makes short shrift of logical solutions to congestion and delay at the airport such as regional alternatives such as Massport-owned Hanscom Field.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

LETTER 171

Arthur Pugsley
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202
attn: MEPA Office

Dear Mr Pugsley:

Please know that I am a registered voter and I am strongly opposed to the construction of Runway 14/32. Our priorities must be a livable city now and long-term (not short-term) tourist, convention, and business growth. Only the former can foster the latter in a lasting, significant manner. 171.1

Sincerely,

Sterling Giles

LETTER 172

April 22, 1999

Bob Durand, Secretary
Executive Office of Environmental Affairs/MEPA Office
Arthur Pugsley, EOEA No. 10458 (Logan Airside Improvements Planning Project)
100 Cambridge Street - 20th Floor
Boston, MA 02202

Dear Secretary Durand:

We are writing in opposition to MASSPORT's Logan Airside Improvements Planning Project and request that your office (i) withhold issuance of a certificate; (ii) require a much more rigorous review of alternatives to the new runway; and (iii) require substantiation and an in-depth analysis of the cause of the purported conditions at the airport. MASSPORT's stated need for the project is two-fold: to reduce delay and enhance safety; the DEIR does not support either claim. In addition, MASSPORT has failed to substantiate its contentions in the public hearings held on this project. The Mayor's Director of Environmental Affairs has submitted comments to the EOEA addressing indirect traffic, congestion, and air pollution impacts of the proposal on the City. We agree that these issues warrant analysis and urge your office to fully consider these comments in your decisionmaking process. In addition, we appreciate your consideration of the concerns discussed below. 172.1

We live in the South End, the primary attraction for commercial and residential development in the City for the last several years. Already we are adversely impacted by the failure of pilots to stick to the flight path of Runway 27. If proposed Runway 14/32 is constructed, the South End will face a 300% increase in flights over our skies. This could potentially halt all development in the South End and result in plummeting property values as well as property taxes. The City, and by extension the Commonwealth, depends on the continued growth of the South End, which has also become an attractive tourist destination due to the historical significance of the area, the diversity of culture, and the nationally recognized restaurants which make the South End their home. 172.2

The measurement of current delays is widely different among MASSPORT, the FAA and an outside consultant. If we're not able to come to some consensus on what the issue really is, how are we going to be able to resolve it? The EOEA should require an independent analysis of the existing conditions and the benefits that could potentially be derived from a new runway from reducing delays, as well as a comparison of any potential benefits to the definite detriments that would occur in terms of noise, air pollution, visual impact and increased automobile traffic. It is likely that the option with the least environmental impact will be the no-build option. MASSPORT's claim that a new runway would enhance safety appears to be little more than a public relations pitch unsubstantiated by any concrete data. 172.3 172.4

There are many alternatives to the new runway that have not been fully analyzed and are too readily dismissed, such as the no-build option or utilizing Hanscom Field or Worcester Regional Airport instead. MASSPORT should be required to demonstrate that there is absolutely nothing they can do at Logan to improve alleged flight delay problems absent construction of a new runway. In addition, there has not been sufficient debate regarding sending small planes (for which the runway is proposed to be built) to Hanscom Field (the airport designed to accept small aircraft). Certainly the environmental impacts associated with utilizing Hanscom, where approximately 40,000 residents would be impacted, pale in comparison with the impacts associated with building a new runway at Logan, where (according to MASSPORT) 1.2 million 172.5 172.6

people are affected. No reasonable person wants planes flying over his head, yet the 1.2 million impacted people in Boston that are saying "no" don't seem to have as much influence as the impacted people in Bedford and surrounding areas. Hanscom is located right on Route128, where most businesses are, where other businesses are trying to reach and where people would benefit most. Another argument against Hanscom has been the need to preserve historical monuments in the area. There is no more historical place in the country than the City of Boston. The red line is only 8 miles from Hanscom, an extension of which would bring people right to downtown Boston and right to Logan airport. An extension could easily be built by going under any historical sites. Airforce One just landed at Hanscom last week, so the facility must be capable of handling all-size planes.

Utilizing the under-utilized Worcester Regional Airport also makes good environmental and economic sense. Most of the people using Logan do not reside in the City, yet it is the residents of the City who bear all of Logan's impacts. If the majority of the people who need to fly out of Massachusetts live closer to Worcester and/or Hanscom, why not make use of the airports closer to their residences rather than expand an airport that is already the most difficult airport to access by both air and land? 172.7

We are stuck with Logan where it is now, but we should not make a bad situation worse. Economic development in the Commonwealth is not dependent on access to Boston only, but access to Western, Central, Northern and Southern Massachusetts as well. If all the economic activity is centralized in Boston and Logan is still difficult to access, then the result will be contrary to what the project proponents are contending; i.e., businesses will look outside of the Commonwealth for both permanent operations and short-term activities (ex. conferences, business meetings).

We respectfully request that the EOEA require a much more exhaustive analysis of the impacts associated with the proposed expansion at Logan than what was presented in the DEIR. We also ask that the agency refrain from issuing a certificate to MASSPORT because the majority of the people don't want it due to the environmental impacts it would cause. If the issues of aircraft delay and safety enhancement are as serious as MASSPORT says, they certainly warrant a more careful examination and selection of long-term, instead of short-term solutions.

Sincerely,

Robert and Kathleen Hathaway

Code	Topic 1	Topic 2	Comment	Response
172.1	Environmental Review Process	MEPA	We are writing in opposition to Massport's Logan Airside Improvements Planning Project and request that your office (i) withhold issuance of a certificate; (ii) require a much more rigorous review of alternatives to the new runway; and (iii) require substantiation and an in-depth analysis of the cause of the purported conditions at airport.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Refer to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of the operational benefits of the Preferred Alternative and to Chapter 6 of the Supplemental DEIS/FEIR for a discussion of environmental impacts of Preferred Alternative.
172.2	Alternatives	Runway 14/32	...we are adversely impacted by the failure of pilots to stick to the flight path of Runway 27. If proposed Runway 14/32 is constructed, the South End will face a 300% increase in flights over our skies. This could potentially halt all development in the South End and result in plummeting property values as well as property taxes.	Both the *Logan Airport 1997 Annual Update* and *Logan Airport 1998 Annual Update* reported that aircraft were not achieving the goals of the 1996 FAA ROD and that further testing was needed to get improved conformance. The FAA is currently funding an analysis of the procedure and meets periodically with the Runway 27 Advisory Committee to report interim findings. The *Logan Airport 1999 ESPR* (previously GEIR) reports on flight track monitoring which includes Runway 27 test results. The Runway 27 departure tracks have been reviewed in more detail in Section 4.3 of the Supplemental DEIS/FEIR.
172.3	Delay	Model	The measurement of current delays is widely different among Massport, the FAA and an outside consultant.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
172.4	Alternatives	Runway 14/32	The EOEA should require an independent analysis of the existing conditions and the benefits that could potentially be derived from a new runway from reducing delays, as well as a comparison of any potential benefits to the definite detriments that would occur in terms of noise, air pollution, visual impact and increased automobile traffic.	To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study.

Code	Topic 1	Topic 2	Comment	Response
172.5	Alternatives	Other Non-Construction Alternatives	Massport should be required to demonstrate that there is absolutely nothing they can do at Logan to improve alleged flight delay problems absent construction of a new runway.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
172.6	Regional Transportation	Regional Airports	...there has not been sufficient debate regarding sending small planes...to Hanscom Field....	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

Code	Topic 1	Topic 2	Comment	Response
172.7	Regional Transportation	Regional Airports	Utilizing the under-utilized Worcester Regional Airport also makes good environmental and economic sense.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Airside Project Draft EIS/EIR for these improvements. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other alternative regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Section 2.2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.

LETTER 173

March 1, 1999

Secretary Bob Durand
Executive Office of Environmental Affairs
100 Cambridge Street
Boston 02202

Attn: MEPA office re: Runway 14/32

Dear Secretary Durand:

This letter requests your office to (1) extend the deadline for the environmental process on proposed new Runway 14/32 so that citizens have sufficient time to analyse Massport's documents and (2) make a final decision that honors the quality of life of near neighbors of Logan Airport. 173.1

If built, Runway 14/32 will inflict an unacceptable noise impact on adjacent neighborhoods all around the airport. It will add capacity, triple use of Runways 9/27 and 15/33 and inflict heavy noise on Boston neighborhoods in particular, including East Boston, Charlestown, South Boston, South End, Beacon Hill, Back Bay, Roxbury, Jamaica Plain, and possibly even further southwest areas like Hyde Park, Roslindale and West Roxbury. 173.2

Building this runway reverses 25 years of pathbreaking noise abatement programs and policies by Massport--which included a noise-abatement overwater take-off turn from Runway 22R, emphasizing overwater use of Runway 15/33, night-time restrictions on noisy planes, and an extensive soundproofing program for schools, hospitals and residences.

Twenty-five years ago the Massport Board initiated these nationally renowned noise abatement policies in an Airport Master Plan (1976) which also included other good neighbor commitments--no further expansion of the land area of Logan, $1 million to the East Boston Health Center, a sizeable payment-in-lieu-of-taxes to Boston and Winthrop, transferring the Belle Isle Marsh to the MDC, conveying blockbusted parcels in East Boston to abutters, moving triple-deckers from Neptune Road to Coleridge Street and a committment to build Piers Park and Jeffries Point Park. These policies have continued through the years until now.

In 1975, everyone said such noise and good neighbor policies would mean the death of the airport and increased danger for airlines and

173.1	Environmental Review Process	MEPA	This letter requests your office to (1) extend the deadline for the environmental process on proposed new Runway 14/32 so that citizens have sufficient time to analyze Massport's documents...	In January 2000, the FAA called for the preparation of a Supplemental Draft EIS (SDEIS) after the conclusion of a SDEIS Panel review process. The SDEIS Panel, which consisted of 6 representatives appointed by the Governor and the Mayor of Boston, met over a ten-month period from March 2000 to December 2000. As a result of the FAA's actions, the environmental review process for the Logan Airside Improvements Project was extended by more than one year.
173.2	Alternatives	Runway 14/32	If built, Runway 14/32 will inflict an unacceptable noise impact on adjacent neighborhoods all around the airport.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-7 of the Supplemental DEIS/FEIR.

RE: Case #10458 Runway 14/32

Dear EOEA,

174.1

This letter requests your office to reject Massport's inadequate Draft Environmental Impact Statement on proposed Runway 14/32 and to require Massport to develop a new DEIS that includes a full, fair and honest presentation of all relevant data, dates and impacts.

174.2
174.3
174.4
174.5

A new DEIS should fully describe benefits from alternative actions, such as (1) diversion to Hanscom Field and other regional airports, (2) gains from peak hour pricing based on a reasonable threshold (115 flights is too high), (3) the high-speed Boston-New York rail service which begins this fall, and (4) a second-major airport, starting from the recommendations in the Massachusetts Aeronautics Commission report. These combined actions can do more to solve any existing Logan delay than a new runway, which even Massport estimates will be effective for five years or less.

Complex solutions to complex problems have been successful before--and at Massport. Twenty-five years ago the Massport Board considered the proposed Runway 14/32 along with operating changes designed to minimize noise and other impacts on surrounding neighborhoods. Then, business interests offered the same knee-jerk reactions about economic and job losses. In spite of those predictions, Massport adopted broad noise-abatement and community restoration policies in a 1976 Master Plan, and the runway was not built.

The airport survived and thrived. Passengers increased from 11 million in 1976 to 26 million in 1998, flights from 260,000 in 1976 to 500,000 in 1998.

Now, by proposing Runway 14/32, the current Massport administration for the first time in 25 years would move over water flights back over residential areas. Small planes would land over water on 14/32; other arrivals would also land over water. This would shift large jet departures, which are noisier,

to Runways 27 and 33 and triple their number. They will fly over the close-in populated areas of East Boston, Chelsea, Everett, Somerville, Cambridge, Charlestown, South Boston, South End, Beacon Hill, Back Bay, Roxbury, Jamaica Plain, Hyde Park, Roslindale, West Roxbury, Brookline and Newton. More people live under these two runways than live under all the other Logan runways combined. Is this a "fair" distribution of noise.

The real issues here are regional fairness and inadequate long-range planning by Massport not the livelier and irrelevant scenarios favored by news coverage. This is not a "turf war" or partisan "political wind." Runway 14/32 is truly about noise, neighborhood destruction, loss of enjoyment and property value. It involves real people and real damage to real people in their homes and neighborhoods. It is truly an environmental issue.

A few specific observations about the DEIS:

1. Peak hour pricing: Of all DEIS deficiencies, the lack of serious analysis of peak hour pricing is the most disappointing. Peak hour pricing would free up Logan airspace and reduce delay by pricing out underloaded carriers. Massport instituted a peak hour program in the 1980s which successfully reduced operations and delay until courts invalidated it as too broad. A legally compliant program was subsequently prepared and ready for implementation in 1990 but has never been tried. Peak hour pricing--a market-based solution--could be in place relatively quickly at a low cost. 174.6

2. Noise:

- There is only one small, unreadable noise contour chart in the EIS, with no identifying city or street name. Its obscurity must be a deliberate deception. A better presentation must be required, and the impact of doubling/tripling noise over residential areas must be made clear. 174.7
- Massport's computer calculations in the DEIS consistently understate noise compared to that measured by microphones in the field. 174.8
- Could Massport have chosen 1993 as base year to minimize the projected noise increase.
- In 2000 the airline fleet is required to be 100% stage III compliant. Noise benefits of 100% stage III equipment should be calculated first, then the impact of 14/32. This serious flaw justifies withdrawal of the DEIS. 174.9

3. Equity: The equity of locating airport noise pollution in the Commonwealth's poorest neighorhoods deserves more than four pages out of four volumes. Massport's unsupported conclusion that low-income communities do not receive a disproportionate impact requires further explanation. 174.10

4. Delay:

- Why does Massport's use a formula which calculates more delay than the FAA's.
- Why is a new runway necessary now since there is less delay than in 1993.
- What is actual delay, as opposed to projected.
- How has, and how might, airline consolidation reduce delay. Why doesn't Massport jawbone airlines into consolidation as airport management is now doing in San Francisco, another delay-prone airport. 174.11
- How much of the delay is caused by snow, fog, airline equipment, airline scheduling/cancellations, air traffic control shortcomings, lack of airside space, etc., rather than wind direction and runway availability.

Runway 14/32 must not be approved until all the relevant issues are fairly, openly and honestly examined and discussed.

Massport suggests restrictions that are enforceable only by the Federal Aviation Administration-- one-way use of 14/32 and "fair" distribution of noise. The FAA's record at enforcing its prior commitments is poor. FAA's tower has not effectively used the Preferential Runway Assignment System to share the noise burden. It has not strongly enforced the Runway 22 departure noise-abatement turn. 174.12

Quite recently, FAA has thrown up its hands about enforcing the Runway 27 departure track over the Fort Point Channel industrial area. After 3+ years of night meetings, residents under the Runway 27 flight path thought we had a commitment from the FAA on this "noise-abatement" departure. Now, as the enclosed article indicates, and as the planes overhead from 6:15 am these last several days prove, the FAA either cannot or will not enforce that agreement mandated after a successful suit won by the Runway 27 coalition.

The State of Massachusetts, must protect us and our environment. Neither Massport nor the Federal Aviation Administration will do so.

Thank you for your consideration of these comments.

Sincerely,

Ann Hershfang

...ght path called the wrong way

...sidents peeved planes stay off course

BY JEFF SKRUCK
STAFF WRITER

Aviation officials last week told members of the Runway 27 Coalition that they have done all they can o maintain flight tracks designed to educe jet noise from the Logan ...ternational Airport which im...acts the South End and several ...ther neighborhoods.

Federal Aviation Administration ...ficials, Massachusetts Port Author... and airline pilots say ...e current flight corridor defined ...y an environmental impact study ...s "unreasonable" and beyond ...urrent technology, said Kurt ...Valter, a member of the Run...way 27 coalition.

But for members of the coa...ition that just isn't good ...nough.

"They say, 'We've done our ... We can't do any better,'" ...aid Walter, a former South End ...esident. "Needless to report, ...e community members are ...ot happy with this report."

...at's more, the aviation officials' latest ...e contradicts what they have said for the ...ear and a half, according to coalition ...bers.

...ey basically said it was doable and a ...nd-a-half later they say, 'We don't know ...nd we can't make it better,'" said ...sia Lyman, president of the coalition. ... Jan. 25 meeting was the latest review ... Runway 27 flight track monitoring, a ...s that began 10 years ago with the ...on's law suit agai... ...AA, resulting ...environmental ...udy.

The purpose of the review process is to contain about 68 percent of departing aircraft within one standard deviation of the flight path, a corridor that hangs between South Boston and the South End. Radar data measures if the planes are following the flight path by determining whether the planes pass through five gates.

Members of the Logan Airport Citizens Advisory Council, FAA, Massport and pilot representatives reviewed flight tracks for September, October and November at the meeting.

"As we suspected, the number of planes achieving all five gates had dropped from 50 percent or so over the summer to an abysmal 34 percent by October," Walter stated in a press release.

The Runway 27 coalition formed in 1978 and won a lawsuit nearly a decade later against the Federal Aviation Administration that led to the coalition and the FAA to work on an environmental impact study. Coalition members have said there has been no successful change in the noise for any of the communities. The coalition continues to meet with the FAA and Massport to fine tune the flight track.

While airport officials said they have pretty much done the best they can with the current technology, the citizens advisory council got some encouragement from Northwest Airlines. Company officials agreed to flight test an improved flight procedure for their planes for the next three months. The planes fly with the latest Flight Management System (FMS) technology, a system that automatically sets a plane's flight path.

Arlene Salac, FAA spokesperson, agreed that aviation officials have done just about all they can with planes that do not use FMS technology. But she said there is room for improvement regarding the planes flying with the new technology.

"It looks like we've taken it as far as we can at this point," Salac said. "If there are any further suggestions, we'll look at that."

Despite the high technology behind FMS planes, they have consistently been veering off track and flying right over the South End since the summer, according to the coalition.

And the high-tech planes only account for about 25 percent of the departures from Runway 27, he added.

Even though airport officials say they are doing the best they can, the citizens council will continue to meet with them quarterly regarding flight track monitoring. Plus, it's a particularly important issue with Massport making its big push for the construction of Runway 14/32.

Massport will present itsproposal for the controversial runway at the Airport Review Committee meeting on February 11 at the State Transportation Building, 10 Park Plaza, conference rooms two and three, from 6 p.m. to 10 a.m.

Runway 14/32 is a uni-directional runway that would serve commuter aircraft. Its skeleton lies underground at the airport. Massport — the state agency that oversees Logan — began construction on the runway more than 20 years ago, but a court order halted the project, following massive opposition from East Boston residents.

The project makes community members from Br... ...eighborhoods and outlying towns ... ...icious of Massport. Many, including ... ...an, say the new ... ...

result in increased use for Runway 27 and many other runways. In short, city neighborhoods like the South End, South Boston, Roxbury, Jamaica Plain and East Boston to name a few, will hear a lot more jet noise.

"I don't think we should let them off the hook," said Walter, regarding the airport officials' cop out at last Monday's meeting. "Especially with Runway 14/32, it will be a complete disaster a decade from now."

The citizens advisory council will try to increase its political pressure, Walter added.

As for next Thursday's meeting, Walter said he's prepared to hear Massport's "song and dance" about how great Runway 14/32 will be for Logan and the city. Peter Blute, who heads Massport, will present projected figures regarding increases of runway use to the Airport Review Committee, which consists of residents and business leaders.

Many neighborhood activists have written off Runway 14/32 as a done deal. Four days after Blute's presentation, the proposal will be filed with the state environmental protection agency, Walter said.

174.1	Environmental Review Process	MEPA	This letter requests your office to reject Massport's inadequate Draft Environmental Impact Statement on proposed Runway 14/32....	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
174.2	Regional Transportation	Regional Airports	A new DEIS should fully describe benefits from alternative actions, such as diversion to Hanscom Field and other regional airports.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives.

Code	Topic 1	Topic 2	Comment	Response
174.3	Alternatives	Peak Period Pricing	A new DEIS should fully describe benefits from alternative actions, such as gains from peak hour pricing based on a reasonable threshold (115 flights is too high).	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport. Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion.
174.4	Regional Transportation	Passenger Rail	A new DEIS should fully describe benefits from alternative actions, such as the high-speed Boston-New York rail service which begins this fall.	Massport's analysis of regional alternatives is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market.
174.5	Regional Transportation	Regional Airports	A new DEIS should fully describe benefits from alternative actions, such as a second-major airport, starting from the recommendations in the Massachusetts Aeronautic Commission report.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Even if a second major airport were to be pursued, the planning period for site selection and environmental review would require ten to 15 years, in addition to a multi-year construction period. Rather, Logan Airport is part of a regional system of airports that includes the T.F. Green/Providence, the Manchester, and the Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
174.6	Alternatives	Peak Period Pricing	[Massport should analyze peak hour pricing more in depth.]	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
174.7	Noise	Impacts	[The EIS noise contours should be made more clear.]	Comment noted. The figures in the Supplemental DEIS/FEIR have been significantly improved since earlier drafts.
174.8	Noise	Model	Massport's computer calculations in the DEIS consistently understate noise compared to that measured by microphones in the field.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
174.9	Noise	Hushkitted Aircraft	In 2000, the airline fleet is required to be 100% Stage III compliant. Noise benefits of 100% Stage III equipment should be calculated first, then the impact of Runway 14/32.	Comparisons of the Action Alternatives to the No Action Alternatives for individual fleet scenarios are the appropriate basis for evaluation and are not distorted. Fleet composition within each individual forecast scenario remains consistent. The phase-out of Stage 2 aircraft will reduce the noise impacts from Logan Airport, producing benefits to surrounding communities. These impacts are discussed in the *Logan Airport 1999 ESPR* (previously GEIR). The 29 M Low Fleet scenario includes 22 daily operations in Stage 2 aircraft (depending on the alternative examined), which represent about 2.5 percent of the total daily jet operations in that fleet. (Refer to Table 6.2-1 of the Supplemental DEIS/FEIR). In the shift to a post-1999, 100 percent Stage 3 fleet, some of these aircraft would likely have received hushkits resulting in very little improvement in the noise of individual overflights (and hence, little improvement in DNL), and some were likely converted to Stage 3 airplanes. However, on balance, the total number of Stage 2 operations in 1999 is small, and a revised 29 M Low Fleet scenario would leave a significant number of hushkitted airplanes to dominate the exposure. For these reasons, it is estimated that the presence of the Stage 2 airplanes in the 29 M Low Fleet scenario overstates noise exposure by only a few tenths of a dB, which does not represent a material difference.

Code	Topic 1	Topic 2	Comment	Response
174.10	Environmental Justice	Impacts	The equity of locating airport noise pollution in the Commonwealth's poorest neighborhoods deserves more than four pages out of four volumes. Massport's unsupported conclusion that low-income communities do not receive a disproportionate impact requires further explanation.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
174.11	Delay	Model	[The delay model is not satisfactory.]	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
174.12	Noise	PRAS	FAA's tower has not effectively used the Preferential Runway Assignment System to share the noise burden.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

Comments not referring to the EOEA file number may not be considered.

LETTER 175

All comments must be received April 22, 1999
All mail concerning the environmental impact review process including filings, comments, and all associated materials must be addressed to:

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. **#10458**
100 Cambridge Street - 20th Floor
Boston, MA 02202

Failure to address mail in this manner may result in delay of action on comments or no action on comments at all.

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

The EIS/EIR does not address the problem of ground airlag because there is not sufficient public transportation to accommodate the air traffic they expect to come to Boston. 175.1

This is a short term solution. With in 10 years we will face the same issues.

175.1	Ground Transportation	Access to Logan	The EIS/EIR does not address the problem of ground delays because there is not sufficient public transportation to accommodate the air traffic they expect to come to Boston.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Annual Updates (Environmental Data Reports).

RE: Logan Airside Improvement Planning Project, DEIR/DEIR

Dear Secretary Durand:

As the Beacon Hill Civic Association representative to the CAC and the ARC my basic opposition to Massport's proposal to construct a new runway at Logan Airport is stated in the letter of opposition from the Beacon Hill Civic Association.

This letter expresses additional opposition based on Massport's inconsistent, unbalanced, and misleading presentation of information. My comments are based on my experience, which also includes on the Technical Subcommittee of the ARC (which included an additional series of technical meetings with Massport and their consultants); in the Boston Redevelopment Authority's Boston Central Artery Depression Feasibility Study in 1974-75 (as Beacon Hill representative); doing business around the world for many years; and as an MIT trained engineer.

Massport has presented overwhelming amounts of information, formally and informally. While most of the volumes of information and their comments are factually accurate, much of their presentation of information in print and verbally is inconsistent, misleading, and deceptive--misinformation. Many normal people are overwhelmed by the information and feel they must agree with the "facts". Despite the quantity, the information is often incomplete and improperly presented; and their conclusions are consequently defective.

Massport's presentation of information, in print and verbally, mixes operations and passengers, quantities and percentages—presenting what at that point is most favorable and omitting what at that point is unfavorable. They should consistently present operations and passengers figures with both quantities and percentages, including subtotals and totals. A few examples: 176.1

1. At the State House hearing March 23, Director Blute talked about "70,000 planes a year using the new runway will be moved over the water." In the next sentences he talked about "the few percent of increased traffic over some communities will more closely match the PRAS percentages agreed to by all the communities." Those 70,000 operations over the water are about 15% of total operations at Logan. Those few percent of flights moved to other neighborhoods includes more than 40,000 operations from Runway 27, more than 30,000 from Runway 33, and more than 10,000 from Runway 22. Since neighborhoods are typically affected by more than one runway, the moved flights increase flights over some neighborhoods by 50-70,000—more than triple current levels. (And, when the PRAS

percentages were formulated in the early eighties, no one agreed to current levels of traffic—increased by 112% over the last 20 years—much less Massport's intended continued increase without limit over time.)

2. At the same hearing, Director Blute threatened that, if the new runway is not built, traffic will still increase and the primary runways will be used for more than 90% of operations to try to satisfy the demand with the least delays. Of course, with the new runway, traffic is still intended to increase without limits; and the primary runways will still be used excessively. It will just take longer for the excess to grow. (No consideration is given to limits on operations, maximum capacity.)

3. Logan's airport ranking as the 11th in the US in operations and the 6th in delays has been widely stated as justification for the new runway to improve the delay ranking. At our February CAC and ARC meetings we noted to Director Blute that the additional ranking of 17th busiest in passengers indicated a lower than average number of passengers on each plane. Getting more people on each plane could also improve the ranking, since the same number of passengers on fewer planes should have fewer delays. At the State House hearing, Director Blute upped the ante by arguing that 17th in passengers while 5th in delays further emphasized the need for the new runway to decrease delays. (No mention was made of the operations 11th ranking or the alternative of getting more passengers on each plane.)

4. Massport details the worsening in rank from eighth in 1990 to sixth in 1997 in their recent DEIS/DEIR (page 1-13), and they note the FAA figure for 1997 of 25.2 delays per 1,000 operations (2½%) (page 1-11). They exclude the FAA delay figures for prior years which have dropped steadily from a peak of 39.23 (under 4%) in 1992 (www.ASC.FAA.GOV). More complete detail was included in their 1995 Airside Improvements Feasibility Study (page I-4), different from the current FAA figures, with usually worse delays but better rankings for the same years. (No ranking adjustment "handicap" is made in any case for inherently worse-than-average New England weather or for the constrained urban location, which may slow airport operations but should speed arrival to urban destinations.)

5. Massport's recent, widely delivered presentations state strongly that the new runway "Significantly Reduces Delays: 20-25% Annually, 45-55% in Good Weather (VFR), and Up to 90% on Northwest wind days." Their 1995 Airside Improvements Feasibility Study estimated that delays were then 80-100,000 hours for the year (page I-4). They forecast 200,000 hours of delay for 1999 and estimated that Runway 14/32 "could reduce delays by approximately 21,000 hours per year", for a 10% reduction (pages V-23 & V-24). Massport's 1997 Annual Update only mentions delays in connection with the Airside Improvements Project (page 3-2)—there is no detail. Their recent DEIS/DEIR estimates "121,000 annual hours of delay in 1998" (page 1-11), separately adds 22,000 hours for taxiway delays for a 143,000 hours total, and updates their 1999 estimates to 136,000-190,000 annual runway delay hours (page 4-33), It also notes approximately 159,000 hours total (135,000 for runways and 24,000 for taxiways) modeled aircraft delay in the 1993 base year (page 4-28). Much of the delay estimates add the runway and taxiway delays together, and much of the benefits estimates combine the Runway 14/32 and Reduced Landing Minimums. However, the difference in runway related delay between "All Actions" and "All Actions except Runway 14/32" is still 20,000 hours for the likely 1999 scenario (page 4-33)—a 16% reduction—and a 22% reduction for the likely future

scenarios. And the FAA's calculations for Logan delays are substantially lower than Massport's estimates. (Under which shell is the pea, which card covers the Queen?)

6. Massport estimated "annual savings of over $65,000,000 may be realized" in their 1995 Airside Feasibility Study, calculating 21,000 delay hours with a $3,100 operational cost per hour (page V-24). Separately, the $3,100 per hour was divided into $900 operating costs of aircraft to the airlines and approximately $2,200 travelers' costs of delay (page I-6). In their recent DEIS/DEIR, the airline cost per hour of delay (considering the Logan fleet mix) is estimated at $1,115; and the time of the average 53 passengers per aircraft is valued at $27 per hour for an average economic cost to passengers of $1,431—and a total value per hour of $2,546. The most likely 20,000 hours estimated to be saved in 1999 now has a decreased $51 million value. (No value is ever put on the negative affects on others—no decreased property value, decreased ability to business, or decreased ability to enjoy life. This can be quickly estimated at 4 hours/day x 5 days/week x 50 weeks/year = 1,000 hours/year/person affected. Valuing diminished ability to work or relax at several dollars per hour for a minimum 500,000 people affected quickly totals more than $1,000,000,000—dwarfing the delay costs side of the full equation. (A recently added $25 million estimate to construct the new runway excludes the cost to demolish and replace existing cargo facilities or to relocate those businesses.)

7. Asked about developing Hanscom, Massport responds that Hanscom is being developed as a reliever airport for general aviation (rather than as a regional airport for commercial passenger and cargo aviation). They note that it already has more operations than Portland, Maine and even their very brief mention of Hanscom in the DEIS/DEIR notes that it ranks second in operations among New England airports, behind Logan (page 2-41). Massport's 1997 Annual Report (page 4-9) notes that 85% (160,000) of the 188,000 annual operations at Hanscom are single-engine piston aircraft and that 41% (77,000) of the operations are touch-and-go flight training operations with single-engine piston aircraft; but Massport does not include this detail in their DEIS/DEIR or verbally. Or that Hanscom, the former US Air Force facility with existing 8,000 and 5,000 foot runways (and now owned and managed by Massport), has unused capacity for 50,000 or substantially more operations—even with the touch-and-gos. (The absence of commercial passenger and cargo operations at Hanscom—located in the middle of more than 50% of the passengers using Logan—both presently and in planning, is not addressed.)

We hope and trust for your actions to deny Massport's current proposal with direction to provide more technically consistent, complete, current, and less biased information. A longer range study and proposal is needed, which more fairly evaluates the positive and negative impacts of facilitating air traffic while respecting the health and wellbeing of all of those affected and of our environment—before any additional expansion of operations is allowed. 176.2

Thank you for your efforts.

Sincerely,

Darryl Pomicter

Code	Topic 1	Topic 2	Comment	Response
176.1	Analysis Assumptions	Passenger Forecasts	Massport's presentation of information, in print and verbally, mixes operations and passengers, quantities and percentages-presenting what at that point is most favorable and omitting what at that point is unfavorable. They should consistently present operations and passengers figures with both quantities and percentages, including subtotals and totals.	The Airside Project involves a substantial amount of technical analysis and data. In public presentations Massport has sought to simplify the presentation of results in order to focus non-technical audiences on major conclusions and summary points. However, all of the technical analysis and data is contained in the environmental documents. Please refer to the main volume and the technical appendices of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR.
176.2	Alternatives	Other Non-Construction Alternatives	A longer range study and proposal is needed, which more fairly evaluates the positive and negative impacts of facilitating air traffic while respecting the health and well being of all of those affected and of our environment before any additional expansion of operations is allowed.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* (previously GEIR) and its updates.

LETTER 177

Mr. Robert Durand, Secretary
MEPA Unit - Executive Office of Environmental Affairs
Attention: Arthur Pugsley, File # 10458 EOA
100 Cambridge Street 20th Floor
Boston, MA 02202

Dear Mr. Durand,

I strongly object to any expansion of Logan Airport runways. I am offended by Massports TV advertisements promoting this expansion. 177.1

Look to the sky as Massports plans for building the new Runway 14/32 will bring 60,000 more planes a year flying over our neighborhoods. By their own data Massport expects a 300% increase in flights!

ttended the hearing at City Hall in the Council Chambers on March 2 at 0 PM opposing any operational expansion at Logan Airport. The chamber was packed with people, mostly from East Boston, Winthrop, Dorchester, Roxbury, Jamaica Plain, Somerville and the South End. I know that I am not the only person in the South End who cant sleep past six in the morning on Saturdays and Sundays in the summer. The planes start flying over every five minutes if the wind is coming from the southwest, and the southwest wind is the prevailing wind from the early spring through the fall. I keep my windows closed but it doesnt help. The windows start to rattle, and I start counting the planes. If I want to sit out on my deck I cant talk on the phone or to a neighbor without having to stop every few minutes as another big bird buzzes my house.
These planes sound like an endless parade of jackhammers. That isnt even the worst of it. These planes are like giant crop dusters filled with deisel fuel emissions, every five minutes! Take a deep breath. There is more. We homeowners in the SE have watched as our homes have doubled and tripled in value, and our tax rates to match. We are a designated historic Victorian neighborhood, a nice ten minute walk from the Statehouse and Boston Common. We are blessed with fabulous restaurants, a vibrant artists community, a great people mix of racial. cultural and economic diversity.
We are on a major flight path for planes taking off from Logan airport.
This is a no - brainer. Who wants to live under a flight path?
Developers will not advertise this feature in their brochures.
Real Estate agents, developers of Washington Street and other SE areas will have a difficult time selling luxury residences in a desirable neighborhood if they have to raise their voices to their customers as they scribe all the amenities. You cant hide noise pollution. Its noisy.
pollution isnt so obvious, but it is more insidious. Air pollution causes heart and lung disease. We, residents of the South End will come

together to stop Massport from turning our neighborhood into the new East Boston. The good people of East Boston have been fighting this war for many years. A war to protect their quality of life from deteriorating any more than it already has. I was very impressed with how knowledgeable these citizens were about levels of organic and non-organic pollutants in the missions from airplane fuel exhaust. Articulate about all the beaurocratic ganizations that they must work with at federal, state, city and local evels. These were working class people who have read these ten year environmental impact reports that cost millions of dollars and are several inches thick and understand them! Massport interprets the end result of all of these studies as a directive to enlarge Logan airport. To quote one of the speakers, who had charts, graphs, maps, and bulleted points on the video screen Expansion of Logan airport will improve the quality of service at Logan. Of Course. It will be a good, short term solution for Logan.
On the other hand it will be a short term and long term disaster for the people who live and work in Boston. The strongest point Massport wanted to make was how good for the economy, jobs and the convention center this new runway would be. Yes, the convention center promises thirteen thousand new jobs! Where will the people who get these jobs come from? Will they be living in the convention center or commuting? Sixty-thousand more planes a year! These are Massports projections so I assume they are a conservative estimate. These planes will need taxies, buses, cars in order to disgorge all these people into the tunnels, coming and going. They claimed at the meeting that the new runway will be unidirectional. Which direction will that be? Only for takeoffs? Only for landings? It doesnt matter. There are too many planes now. More planes are just that, more planes. If Massport builds it, yes, they will come.
The problem is where will we go? At the meeting Massport representatives talked about giving back to the communities. I didn't know this, but Massport has actually paid homeowners in East Boston to soundproof their homes from the noise! Talk about palliative Band-Aids. This works great if never want to go outside. They have built parks and baseball fields for kids in Eastie. Another bandaid. Would you want your kids running around a field as jumbo jets spew toxic emissions overhead? Would you want to sit in a park breathing in this stuff? Listening to the noise? Massport cannot pay us all off, build more parks, insulate our homes enough to make this problem of quality of life go away.
We are the endangered species here.
I suppose Massport could supply citizens of Boston with headsets and gas masks in the future, but I think this would be sending a distasteful message to all the tourists and conventioneers arriving in our fair town, unless they were all supplied with their own pollution kit as they emerge from their flight.
We want them to have a good experience after all.
The people of Boston and our legislators have fought to clean the harbor waters. One of the most beautiful harbors in the world, I think, rivaling San Francisco's.
This is a unique, priceless visual and economic resource in our city. Closed off to us by big buildings and expressways. Guess what the beautiful downtown greenbelt will be like after the elevated expressway is torn down. Prime Real estate turned into a flight path for noise and air contaminants.
Castle Island, in South Boston, is a spectacular place to view the harbor the Islands and the skyline. It is regretfully unbearable to spend any length of time there, especially in the mornings and evenings at peak take off and land times. You can almost touch the planes that take off and land every few minutes. It is impossible to have a conversation as the planes roar overhead, never mind the smell of exhaust fumes. Now we must take our battle to the

wont abdicate our Air Rights to Massport for the sake of the convention center, or for the sake of all these corporations and businesses that

Massport claims must have a major international airport right in the heart, at the very entrance to this city. No.
Travelers all over the world do not base their destinations on the proximity of the airport to the center of town. Think about this. London, Paris, Tokyo, Rome, New York all have international airports that are one or two (depending traffic conditions) hours from the heart of the city. Orly and Heathrow ch have high speed rail transports. When was the last time you said to yourself Im not going to go to London because the airport is an hour or more outside of town!
Lets think Big. Get really creative. Think outside of the grid (lock).
Downsize Logan into an air commuter and Eastcoast flights only airport.
There are other solutions to expanding Runway 14/32.
The most profound speaker of the evening was a young man who looked like he was about ten or twelve years old from East Boston.
This is what he said;
The planes are noisy and wake me up at night so I cant sleep, they also smell real bad. Thats it in a nutshell. Plain speaking, common sense.
We in Boston are waking up from the noise and smelling the fumes.

Protect us. Protect our town from this assault on our health, our property values and the daily quality of our lives here in Boston.
Say no to Runway 14/32 once and for all.

Sincerely,

Beverly Sky

177.1	General Opposition		I strongly object to any expansion of Logan Airport runways.	Comment noted.

LETTER 178

April 22, 1999

FAA Office of Airports
800 Independence Avenue, SW
Washington, DC 20591
Room 600 East

Dear Madam or Sir:

I am writing to complain about the growing number of planes that take off directly over the city of Boston from Logan Airport. According to Massport officials, this noise is caused by the use of the runway configuration 33/27, which is used based on wind and other factors. This runway is often in use during the very early morning hours and late evening hours, since according to Massport officials its use during peak hours would cause too many delays at the airport. Planes are constantly departing directly over the central city, from 6:00am to 11:00pm. The situation has become unbearable. 178.1

After repeated calls to Massport over the past year, the situation continues to worsen. The departure route is the most densely populated take-off routing from Logan, by far. This routing is almost never used for arrivals. I have found that no matter the wind condition, this configuration is often used. Based on reports that I have received from Massport, this routing is used in various wind conditions. On Sunday, March 14, it was also used in calm wind conditions. In addition, stage II aircraft are not allowed to land or depart Logan before, 7:00am. This is not the case, as I have visually observed stage II aircraft depart from as early as 6:15 am. 178.2

Massport and the FAA need to address these concerns and avoid disrupting the life of Boston resident at the benefit of the more wealthy suburbs. It makes no logical sense to have planes take off directly over the most densely populated area in the region, especially at times when people are sleeping. Flights should be arranged to take off over the ocean and over less populated areas. 178.3 At the same time, Massport needs to find a solution to overcrowding of the runways by finding an alternate site for airport expansion, such as Hanscom Field, and not a new runway at Logan. 178.4

Thank you and best regards,

John Stewart.
34 Rutland Square
Boston, MA 02118

Letter 178

Code	Topic 1	Topic 2	Comment	Response
178.1	Noise	Runway Use	Planes are constantly departing directly over ... central [Boston], from 6:00 AM to 11:00 PM. The situation has become unbearable...and the situation continues to worsen. The departure route is the most densely populated take-off routing from Logan, by far. This routing is almost never used for arrivals.	Table 6.2-17 of the Supplemental DEIS/FEIR shows nighttime jet operations projected to increase from 144 in 1998, to as many as 231 under the No Action Alternative with the 2015 High Regional Jet Fleet. However, regardless of the fleet, many of the future night operations are the result of delays that will occur as demand at Logan Airport continues to increase. One of the direct benefits of the Preferred Alternative is that it will reduce these night operations by 32 to 43 flights depending on the fleet forecast, though *any* alternative to the No-Action scenario will help alleviate some of the projected delays. In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.
178.2	Noise	Nighttime Noise	Stage II aircraft are not allowed to land or depart Logan before, 7:00 AM. This is not the case as I have visually observed Stage II aircraft depart from as early as 6:15 AM.	By Federal regulation, as of December 31, 1999, Stage 2 airplanes weighing more than 75,000 pounds are no longer permitted to fly in the continental United States. There are, however, Stage 2 airplanes less than 75,000 pounds which the FAA still permits to operate. Thus, Massport continues to enforce its nighttime noise rules which apply universally to all weights of aircraft.
178.3	Noise	Nighttime Noise	It makes no ... sense to have planes take off directly over the most densely populated area in the region, especially at times when people are sleeping.	The preferential runway rules at Logan Airport have late night departures on Runway 16 over the harbor as the highest priority to minimize departures over highly populated neighborhoods. The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.17 and 6.2.18 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.

Code	Topic 1	Topic 2	Comment	Response
178.4	Regional Transportation	Regional Airports	...Massport needs to find a solution to overcrowding of the runways by finding an alternative site for airport expansion, such as Hanscom Field and not a new runway at Logan.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.

from the desk of
VINCENT R. TINO

LETTER 179

March 29, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

Although I support social progress and economic growth for the Commonwealth, I believe the addition of Runway 14/32 would only be a temporary solution to a long-term problem. The lack of available land and buffer area poses many barriers to growth at Logan International Airport. Therefore, I feel that a second airport would better serve the region. To currently increase capacity, the airport should use its available configuration to more efficiently move passengers. Therefore, private civil aviation and cargo operations should be relocated to suburban airfields. Operations at Logan should cap annual Landing/Takeoff operations (LTO) but strive to maximize passenger throughput with increased passenger-to-LTO ratios. In addition, relocating regional air commuting to suburban airfields would help to relieve delays. 179.1 179.2 179.3 179.4

With these concerns, I provide to you my comments on the Logan Airside Improvements Planning Project, Volume I, Draft Environmental Impact Statement/Report (February 1999).

Chapter 6.3 discusses the air quality impacts associated with the proposed project. Section 6.3.1 discusses the methodology used in the air quality analysis. The methodology states that the Logan Dispersion Modeling System (LDMS) was used to assess air quality impacts. Although the methodology used appears to be technically sound, the analysis fails to follow guidelines set forth by the both the U.S. Environmental Protection Agency (EPA) and the Federal Aviation Administration (FAA) for air quality analyses. Appendix W of 40 CFR Part 51 lists the Emissions and Dispersion Modeling System (EDMS) as the preferred dispersion model for airport air quality analyses. The Federal Register (dated April 13, 1998) states that FAA policy (docket number 29194) requires the "use of EDMS to assess the air quality impacts of proposed airport development projects." Although the analysis states that the Massachusetts Department of Environmental Protection (DEP) and EPA Region I approve of the LDMS, the FAA policy statement regarding EDMS is not addressed. Both references are included for your review. 179.5

Section 6.3.1.2 discusses the inputs for the dispersion modeling analysis. The highest and most conservative concentrations found in any airport air quality analysis are usually found at the property boundary of the airfield. However, property boundary receptors are not included in this analysis. Although the included receptors were specifically selected by DEP, these receptor locations may fail to predict the most conservative concentrations, since the receptors are at points located a significant distance from the airport property. For an airport in such close proximity to residential neighborhoods, it is likely that maximum concentrations would occur at the property boundary and very close to residential neighborhoods. Thus, the maximum concentrations provided in Tables 6.3-10 through 6.3-14 may be underestimated and may fail to comply with National and State ambient air quality standards. 179.6

Section 6.3.2 presents the results of both the emissions inventory and dispersion modeling. Table 6.3-2 presents maximum background concentrations of carbon monoxide (CO), hydrocarbons (HC), nitrogen dioxide (NO_2), and particulate matter less than 10 microns in diameter (PM_{10}). Although Table 5.3-2 states that the second highest nearby annual 24-hour average PM_{10} concentration in 1995is found to be 52 micrograms per cubic meter ($\mu g/m^3$), Table 6.3-2 reports a value between 45-48 $\mu g/m^3$ be added as background. Similarly, the annual background PM_{10} concentration is shown to be 24 $\mu g/m^3$ (in Table 5.3-2, 1996) while the value added as background in Table 6.3-2 is shown to be 23 $\mu g/m^3$. Also, it appears that the unit conversion from background values in parts per million (ppm) to $\mu g/m^3$ has been performed inconsistently and with errors. The following table presents a summary of the calculations: 179.7

Pollutant	Averaging Time	Reported Second Highest Background		Implied Conversion Factor	Average AP-42 Conversion Factor	Corrected Second Highest Background
		ppm	$\mu g/m^3$	$(\mu g/m^3)/ppm$	$(\mu g/m^3)/ppm$	$\mu g/m^3$
CO	1-hour	7.7	4446	577	1140	8778
	8-hour	4.9	2262	462	1140	5586
NO_2	1-hour	0.09	173	1922	1880	169
	Annual	0.03	58	1933	1880	56

It is clearly shown that the conversion of CO and NO_2 from ppm to $\mu g/m^3$ has been performed with some inconsistency. Differences in the NO_2 factor could quite possibly be found in the assumptions of temperature and pressure. However, the discrepancies in conversion factors for CO are significantly different and discrepancies in the factors between pollutant averaging times should not occur. The conversion table from Appendix A of U.S.

EPA's Compilation of Air Pollution Emission Factors (AP-42) is also provided for your review.

It is unclear if background concentrations are included with the maximum concentrations presented in Tables 6.3-10 through 6.3-14. Table 6.3-2 presents maximum background annual NO_2 and PM_{10} concentrations of 53-58 $\mu g/m^3$ and 23 $\mu g/m^3$, respectively. Tables 6.3-10 through 6.3-14 present maximum total NO_2 and PM_{10} concentrations of 55 (or 56) and 24 $\mu g/m^3$, respectively. Firstly, the higher background concentration (in this case 58 $\mu g/m^3$) should be summed with the highest modeled concentration to produce the more conservative result. It appears that the lower background NO_2 concentration was added to the modeled value. Secondly, it appears that modeled annual concentrations of 3 $\mu g/m^3$ for NO_2 and 1 $\mu g/m^3$ for PM_{10} (inferred as the differences between background and total concentrations) are surprisingly low for airport air quality analyses and should be checked for errors.

Particulate emission factors for the majority of aircraft engines are generally unavailable. Only limited amounts of data for total suspended particulate (TSP), not PM_{10}, from a few older engines exist. Yet the analysis presents PM_{10} emissions from all sources, including aircraft. Therefore, either particulate emissions from aircraft where factors were unavailable were omitted, or significant assumptions relating to aircraft PM_{10} emissions were made. These assumptions would be capable of greatly varying the results of the analysis.

Based on my review, I suggest that both the Massachusetts Secretary of Environmental Affairs and the FAA Regional Manager of Environmental Programs review the above comments thoroughly before final approval of the proposed project is made.

Sincerely,

Vincent R. Tino

Code	Topic 1	Topic 2	Comment	Response
179.1	Alternatives	Runway 14/32	...I believe the addition of Runway 14/32 would only be a temporary solution to a long-term problem.	The Airside Project analysis is based on alternative 20-year forecasts of operations by aircraft type. Only larger aircraft compatible with the existing facilities at Logan Airport are included in the future forecasts for Logan Airport fleets on which the delay and environmental analyses are based. Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.
179.2	Regional Transportation	Regional Airports	...a second airport would better serve the region.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.
179.3	Regional Transportation	Regional Airports	...private civil aviation and cargo operations should be relocated to suburban airfields.	Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport (as of January 15, 2000). Massport plays no role, however, in the decisions of private airlines regarding air service routes or service levels. As proprietor of Logan Airport, Massport's primary responsibility is to supply, operate, and maintain Logan Airport's infrastructure which includes the runways, taxiways, terminal buildings, parking facilities and access roads. As a recipient of federal airport grants, Massport must adhere to grant covenants that require it to operate Logan Airport in such a way so as to ensure access and availability for public use on fair and reasonable terms and without unjust discrimination.
179.4	Alternatives	Other Non-Construction Alternatives	Operations at Logan should cap annual Landing/Takeoff operations (LTO) but strive to maximize passenger throughput with increased passenger-to-LTO ratios.	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.

Code	Topic 1	Topic 2	Comment	Response
179.5	Analysis Assumption	Air Quality	...the Logan Dispersion Modeling System (LDMS) was used to assess air quality impacts. Although the methodology used appears to be technically sound, the analysis fails to follow guidelines set forth by the both the U.S. Environmental Protection Agency (EPA) and the Federal Aviation Administration (FAA) for air quality analyses.	The dispersion model portion of the LDMS is an EPA-approved model. The methodology is consistent with FAA and EPA guidelines.
179.6	Air Quality	NAAQS	Thus, the maximum concentration provided in Tables 6.3-10 through 6.3-14 may be underestimated any may fail to comply with National and State ambient air quality standards.	The model and methods used to develop these data were based on EPA- and DEP-approved guidelines and show that the NAAQS will not be violated.
179.7	Air Quality	Model	[There are inconsistencies that need to be either explained or corrected in Section 6.3.2 of the DEIR/DEIS air quality analysis.]	The model and methods used to develop these data were based on EPA- and DEP-approved guidelines and show that the NAAQS will not be violated.

LETTER 180

April 16, 1999

Secretary of Environmental Affairs
Logan Draft EIR
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02205

Dear Mr. Pugsley:

After reviewing Draft Environmental Impact Statement/Report submitted by the Massachusetts Port Authority I am left with the impression that it is little more than carefully directed obfuscation. The objective of Massport is the expansion of Logan Airport's landing capacity. The draft document states the agency's justification for this goal without sufficient consideration of the negative environmental consequences or serious consideration of alternatives. The confused logic of Massport does not support the expansion of a poorly located facility at the expense of its already disadvantaged neighbors.

The report does not adequately consider which segment of the population will bear the most serious adverse consequences of airport expansion. The addition of Runway 14/32 and the centerfield taxiway will have a disproportionate negative impact on minority and low-income neighbors of Logan Airport. Property owned by people in lower socio-economic groups will face reduced property values to increased aircraft noise. 180.1

In the area where I reside, for example, the East Boston and Chelsea communities, these people tend to be recent Hispanic immigrants. The report is silent on why these people must face lowered property values while residents of the communities surrounding Hanscom Airport are not confronted by, or seriously considered for, proportionate losses.

While the draft report ignores the weaker neighbors of Logan International Airport, it also fails to adequately consider a very powerful and persistent neighbor. More powerful than the opposition any human opponent may muster is the might of the North Atlantic. As one looks at a map, located just to the right of Logan is the weather engine that is responsible for the flight delays Massport now seeks to appease by runway expansion. Weather happens. No rational amount of expansion will abate the weather delays caused by the proximity of Logan Airport to the North Atlantic. Inland alternatives

Code	Topic 1	Topic 2	Comment	Response
180.1	Environmental Justice	Impacts	The addition of Runway 14/32 and the centerfield taxiway will have a disproportionate negative impact on minority and low-income neighbors of Logan Airport. Property owned by people in lower socioeconomic groups will face reduced property values due to increased aircraft noise.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

LETTER 181

Mr. Pugsley,

As a new resident to the City of Boston (SouthEnd), I am very surprised at the amount of airplane noise that is already present in this location. Increasing this three-fold by building runway 14/32, will add considerable discomfort and truly have a very negative effect on our lives here. 181.1

Boston's reputation as a livable city has caused its real estate to skyrocket. Gentrification has beautified this area and increased property values to an incredibly high level. Business, tourism and ultimately money has come to this city because it is one of the most beautiful cities in the US. Building a new runway can deteriorate this growth.

Every major city in the US is served by two airports. All of these airports are at a distance (1 hour) from the heart of the city. Other than Logan, Providence and Worcester airports, already built and not maximized, should be the 2nd and 3rd major airports for the City of Boston.

Spend the effort on improving transportation between these cities and Boston, and every person who lives in Massachusetts and every business that wants to relocate or do business anywhere in the state, will have superior and quick access to air transportation. 181.2

Thank you,
Barbara A. White

181.1	Noise	Impacts	As a new resident to the City of Boston (South End),I am very surprised at the amount of airplane noise that is already present in this location. Increasing this three-fold by building runway 14/32, will add considerable discomfort and truly have a very negative effect on our lives here.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
181.2	Regional Transportation	Regional Airports	Spend the effort on improving transportation between ...[Providence, Worcester] and Boston, and every person who lives in Massachusetts and every business that wants to relocate or do business anywhere in the state, will have superior and quick access to air transportation.	MassHighway is preparing a Draft EIS/EIR an improved access to Worcester Regional Airport.

LETTER 182

4 Rutland Square
Boston, MA 02118-3106
April 20, 1999

Arthur Pugsley
Executive Office of Environmental Affairs
100 Cambridge St
Boston, MA 02202

Dear Mr. Pugsley,

I am not in a position to evaluate the health problems that would result from the construction of Runway 14/32, although I understand that incidence of respiratory diseases is already abnormally high in areas affected by Logan flights. I would like to comment, however, on the effect of noise pollution in the neighborhood where I live. The South End is an historically unique neighborhood, and one of those delightful downtown residential neighborhoods which give Boston its special character and must be the envy of cities affected by inner city blight. A friend living on Union Park, certainly one of Boston's finest residential squares, has already sold her condo finding present noise levels from low-flying jets intolerable. The mere possibility of a tripled flights has discouraged me from building a roof deck to take advantage of the commanding view. My understanding is that support for the proposed runway is to be found mainly in the business world. I pay more than $7000 annually in real estate taxes, roughly 10% of my income, and make minimal demands on public services. I would not be willing to do so if there were a substantial increase in flight noise. The business community might find their enthusiasm for the runway waning if the tax basis eroded and their well-heeled clientele sought peace and quiet elsewhere. 182.1

Sincerely,

Robert Wynne

Re: Proposed Runway 14/32 - Logan Airport

Dear Mr. Pugsley:

I am concerned about the effect of the proposed new Runway 14/32 on the entire Boston area as well as the South End. Regardless of a new runway, and according to Massport's own projections, demand for passengers and aircraft to come to the area is expected to grow significantly, and flight delays are expected to soar. As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in **extreme danger**. 183.1

The City of Boston and the South End neighborhoods have worked very hard over the last 15 years to bring back the South End and make it a desirable neighborhood once again. When I moved there 15 years ago there was little, if any, air traffic noise. Now it is almost constant. At times, it sounds like a war zone. I must say that now being aware of this, I would not again buy in the South End and I am sorry to say that I am hearing other people express the same feelings about living in downtown Boston area which is, indeed, a shame. In addition to the noise pollution, there is also the air pollution to consider.

Please know that I support economic growth for Boston. Communities are working with Senator Travaglini, Congressman Capuano, Congressman Markey, Representative O'Flaherty, Representative DeLeo and others in support of potential solutions to the regional air transportation problem, such as secondary airports, etc. We need you on our side. There are

answers to the problem which could bring economic benefit outside of Boston without increasing capacity at Logan which is not the answer. To increase capacity at Logan would be severely detrimental to those of us who call the Boston area home and, ironically, to those visitors expected to fly here as well. Our health and safety are already at great risk. Our noise and air pollution has increased each year and we cannot accept more. 183.2

Your attention to this serious issue is needed. I urge you to meet with the group of city officials and community leaders in opposition to the new Logan runway to hear the concerns of the residents regarding our health and the environmental impact of this proposal. There are serious questions regarding the adequacy, quality and reliability of information supplied by Massport. I ask you to understand that the quality of life of the Boston area residents is threatened. Thank you for your anticipated attention to this request.

Sincerely,

Edwina Yezierski

Code	Topic 1	Topic 2	Comment	Response
183.1	Alternatives	Preferred Alternative	As a physically small inner-city airport, Logan has exceeded reasonable capacity and cannot handle the dramatic projected demand without putting Boston, the Harbor and surrounding communities in extreme danger.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
183.2	Alternatives	Preferred Alternative	To increase capacity at Logan would be severely detrimental to those of us who call the Boston area home and, ironically, to those visitors expected to fly here as well.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.

Re: Proposed Runway 14/32 - Logan Airport

Dear Mr. Pugsley:

Enclosed is a copy of a recommended solution to the proposed Runway 14/32 issue which was presented by Michael S. Dukakis and appeared in the Boston Sunday Globe on April 25, 1999. 184.1

I feel this is an excellent article and his suggestions should be seriously considered and implemented as a permanent solution to transportation needs of the City of Boston. 184.2

Thank you for your attention to this matter.

Sincerely,

Edwina Yezierski

Common sense can solve Logan's problems

MICHAEL S. DUKAKIS

I thought Anna DiFronzo and a group of outraged East Boston residents had buried the plan for a new runway at Logan Airport forever back in the 1970s.

Unfortunately, like Godzilla, it's back – and this time it makes even less sense than it did 25 years ago.

Why? Because it is a very short-term solution to what is a long-term problem that won't be solved by putting another runway in Boston Harbor. That problem can be solved by using three important tools that are now available to us.

The first is Amtrak's new high-speed Acela express service, which begins this fall – 10 trains a day between Boston and Washington that will carry thousands of former shuttle sufferers quickly and easily from Boston to New York in three hours, downtown to downtown. No more metal detectors. No more fuming at delays in the airport and on the runway. No more $30, one-hour cab rides from LaGuardia into downtown New York.

And if you happen to live west of Boston, you can forget about fighting your way through the tunnels to Logan and a $16-a-day parking tab. A new Amtrak station with 2,000 parking spaces will be waiting for you at Route 128.

The second is not one, not two, but three regional airports, each close to an older urban community that wants and needs growth. Manchester, N.H., Worcester, and Providence are all within easy driving or rail commuting distance of thousands of Logan users who can be better served by these airports. Providence is already connected to Boston by road and rail, and a new station stop at T. F. Green Airport will be just minutes by a moving sidewalk from the terminal.

The Massachusetts Turnpike Authority should get cracking on a spur from the turnpike to the Worcester Airport, which is just a few minutes' shuttle ride from the magnificently restored Worcester railroad station. New Hampshire already plans to build a new highway connection to the Manchester Airport, and it wouldn't take much to extend existing commuter rail lines there as well.

Finally, some simple management steps at Logan would open up even more capacity for the longer flights that Logan is uniquely equipped to provide. We tried one – peak pricing for small aircraft – in the 1980s with spectacular success.

In fact, Logan went almost overnight from 18th to 2d among the nation's major airports in on-time performance. Unfortunately, the small-plane lobby went to work on the Reagan administration, and we were ordered to revoke our landing-fee plan. But there is absolutely no reason why puddle jumpers should be taking up valuable airspace during some of Logan's busiest hours. Peak pricing requires them to adjust around those hours, and there are plenty of smaller airports in addition to Manchester, Worcester, and Providence that can accommodate them as well.

Mayor Menino had the good sense to call for a commission to study the subject. Governor Cellucci should call a summit meeting of his fellow governors from New Hampshire and Rhode Island and the mayors of the four key cities that are involved. They should each bring their top transportation planners with them. Stan Bagley, a Massachusetts native and the chief of Amtrak's Northeast division, should join them. In a matter of months they could put together a plan that would dwarf the piddling contribution that a new runway would make to the problem.

Then we could bury this misbegotten proposal once and for all with appropriate ceremonies and pronounce a final benediction over it.

Rest in peace.

Michael S. Dukakis, former governor of Massachusetts, is a professor of political science at Northeastern University and vice chairman of the Amtrak Reform Board.

184.1	Alternatives	Peak Period Pricing/Regional Airports/Passenger Rail	[Instead of the proposed project, Massport should pursue use of Amtrak high speed rail; the regional airports at Worcester, Manchester, and Providence; and peak period pricing.]	Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
184.2	Regional Transportation	Regional Airports/ Passenger Rail	Governor Cellucci should call a summit meeting of his fellow governors from New Hampshire and Rhode Island and the mayors of the four key cities that are involved. They should each bring their top transportation planners with them...In a matter of months they could put together a plan that would dwarf the piddling contribution that a new runway would make to the problem.	In November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Section 2.2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.

4/11/99 LETTER 185

OPPOSED TO RUNWAY 14/32"

Dear Mr. Pugsley,

Haven't Bostonians endured enough expansion, noise, traffic and general upheaval with "The Big Dig"?

Why not wait until that project is finished before deciding if we can and need to expand our airport?

Please oppose the proposed new runway at Logan airport! 185.1

Sincerely

LETTER 186

NAME:
STREET:
CITY:
DATE:

Arthur Pugsley
Executive Officer of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

SUBJECT: Runway 14/32 Environmental Impact - **PLEASE STOP THE RUNWAY**

Dear Mr. Pugsley:

I am a long time resident of the South End in Boston. This letter is my request that you seriously consider the unacceptable negative environmental impact that the proposed new runway at Logan Airport will have on me and all residents of Boston.

Even without a new runway the current situation has been virtually intolerable since MASSPORT changed flight patterns last September. What used to be quiet neighborhood with only an occasional police siren is now a nonstop parade of airplanes directly over the South End. The planes start at 6:00 am in the morning and go every 4-5 minutes during peak hours. It's bad enough inside the house when you cannot hear your TV or your telephone. Outside of the house you must stop your conversation on the street while the planes pass overhead and hope you can finish before the next one comes along. I dread the thought of what it will be like on my roofdeck this summer !!! What used to be pleasant experience has turned into a nerve wracking NOISE FEST !!! 186.1

Please consider the unacceptable negative environmental impact the additional NOISE from another runway at Logan Airport will have on the residents of Boston. Our quality of life has been compromised enough for the sake of MASSPORT. Who will want to live here if airplane noise levels triple as a result of a new runway ?? Please save our environment.

PLEASE STOP THE RUNWAY !

Thank You,

Marina Cotton

186.1	Noise	Impacts	[The proposed project will have adverse noise impacts on the residents of the South End neighborhood of Boston.]	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR. The Day-Night Sound Level (DNL) data from Noise Monitor No. 1 at Andrews Street in the South End show levels of 56, 55.2,and 56.9 dB for the 29M Low, 37.5M Low and 37.5M High Fleet scenarios with the Preferred Alternative. These levels are less than the1993 value of 57.9 dB and are well below the standard DNL criteria of 65 dB. 1993 is representative of historic high fleet operating conditions at Logan Airport.

LETTER 187

Sir:

I am opposed to the plans to build a new runway at Logan Int'l Airport, Boston, MA. I was a member of the successful class action suit that caused Massport and the FAA to do an EIS fo ther Runway 27 departure flight path that was illegally changed without benefit of one.

Once again, Massport is trying to slip something over on the communtites by trying to get capacity and expansion of the airport accomplished using half truths, faulty data, and political manipulation.

187.1

The "delay issue" is an obviously false one which many others have spoken to being based on faulty data and not solving any problem for more that a year or so, if that. It never takes nto consideration the actual "on time" records of the various airlines that use Logan. The recent report that rated and ranked airlines for just that shows that certain airlines are more delayed because of internal practices (such as baggage handling etc). Many of these airlines heavy users of Logan. How was this factored in? It wasn't.

187.2

The environmental justice issue must be taken seriously, not just on the basis of per capita income but on what the impact of a new runway would have on people no matter what their income. It took those of us who lived under the flight path of Runway 27 years to get a fair resolution This new runway would increase Runway 27's use by 300% according to Massport's own figures. Is this justice?

Peter Blute and his staff have not been fairhanded with those of us who were willing to work on this issue. Delays were manufactured until the current Governor's inauguration at which time a full press for a PR campaign began. It promoted the new runway to the business community and tried to pit separate communities against each other . Phone calls for information went unanswered and meetings were discontinued.

Mr Blute was reluctant to give us additional time for comments because he and his staff wanted this slipped through as fast as possible. They adhered to a mere shadow of the letter of the law.

Statistics were manipulated. delays were based on the best model for Massport and used the worst yeat, ignoring later improvements, environmental issues were ignored, citizens were denied information and access to timely meetings, opposing stories were told to different communities for the best "spin" for Massport.In short. this EIS process is a sham.

I have been involved with Massport for many years. My daughter was in kindergaten when the first planes illegally boomed over my newly purchased home. That was 22 years ago! Yet, I can say that all other Massport management personnel have been respectful of citizens and fair. The current Massport is fascistic at best and I sincerely hope that no hanges tothe airport take place under its reign.

Solutions to the desire to increase capacity at Logan have been well addressed by others but boil down to the fact that Logan and the infrastructure surronding it are simply out of space. We must look elsewhere. Politics and community income level should not be the straw that breaks the Massachusetts camel's back! Outlying communities must be asked to do what those of us closer in have been asked...to share the burden.

Please deny this project.
Thank you.

Code	Topic 1	Topic 2	Comment	Response
187.1	Delay	Model	The "delay issue" is an obviously false one which many others have spoken to being based on faulty data and not solving any problem for more that a year or so, if that.	The FAA consistently rates Logan Airport as one of the most delay-prone airports in the United States. Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. The FAA Technical Center simulated Logan Airport operations in 1992 and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Supplemental DEIS/FEIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29 M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates with those of the Airside Project modeling. The FAA has concluded that the Airside Project delays represent "a plausible and conservative estimate". Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.. Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
187.2	Environmental Justice	Impacts	The environmental justice issue must be taken seriously, not just on the basis of per capita income but on what the impact of a new runway would have on people no matter what their income.	The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Refer to Section 6.2 and Section 6.8 of the Supplemental DEIS/FEIR, respectively, for additional information on noise impacts and environmental justice.

LETTER 188

Dear Mr. Pugsley,
We are writing as residents of Cambridge, MA (near the Somerville border) in opposition to the construction of an additional runway at Logan Airport. The noise levels of flights currently flying directly over and near our home has increased significantly, in spite of the claims of Massport that flights have not increased. Even with the windows closed and storm windows in place, we are awakened from sleep in the early morning (before 6 AM) and well after 11:00 PM. We have begun to use a "white noise" sleep aid but have have found that the sound of the airplanes still cannot be drown out. At certain times of the day or evening, the flights seem constant - spoiling the ambiance of a quiet conversation or the pleasure of listening to the radio or television or reading a book.

We do not live anywhere near Logan Airport yet the quality of our lives is significantly negatively impacted by the noise caused by the current level of flights tracking over/near our home. It is has increased so much that we have talked about moving in order to get a decent night of sleep and in order to relax when we are home. We are angry that we would have to even consider that option! We cannot even imagine the nightmare of noise pollution over our home and all over this city if the additional runway is allowed to be built. 188.1

The noise pollution burden on the communities (both next to the airport and in its flight paths) is enormous already. Although we are not sure what measures you utilize to determine "environmental impact," we hope that you will seriously consider the negative impact on the psyche of the citizens affected by the constant drone of airplanes overhead. If anyone at MEPA has any questions about whether we exaggerate, we invite them to spend a weekend with us. Please stop the airport expansion.

Thank you for your attention to this important matter.

Sincerely,

Massport Runway 14/32 Proposal

Dear Mr. Pugsley
I am a pilot, I am an air passenger and I am a resident living beneath the Logan airspace.

Logan is a poorly placed facility. It suffers the same problems as National Airport, serving Washington DC, Love Field in Dallas or Meigs Field in downtown Chicago. These outmoded airports have survived because of their proximity advantage to the city centers.

But none of them have a bright future. National's operations have been reduced by 15% from what they were 20 years ago. Love Field has been converted into a corporate jet park, with limited commercial traffic and Meigs Field is expected to be closed in three years for a Park project. None of these airports have been able to change because other alternatives have been developed for these other metropolitan areas.

What has changed in all of these cases is people have come to realize that airport operations and urban land use criteria are in direct conflict. Building and/or restoring sustainable cities cannot occur with the land use demands commensurate with large commercial jet operations. Enjoyment of our parks, waterfront, historic sites and other outdoor resources are clearly degraded by aircraft noise.

A "fragile peace" exists between the needs of urban living and airport operations. The people within the airspace have, in general, accepted the present level of air traffic, as limited by the current runway configuration. The residents have chosen their communities and have made billions of dollars worth of real estate investment based on the present set of urban criteria; which have included the present level of air traffic and noise, as limited by Logan's present runway configuration.

The public has accepted the peace. So should Massport. The status quo should be sustained until such time as we have advanced our region's transportation vision for the future. We are moving towards an end to our dependence on air travel. 189.1

Nothing in the Massport proposal is innovative. I believe that the 320 degree approach/ 140 degree departure scheme is unworkable. Try to imagine coach instructions to aircraft to report position downwind of the runway when downwind is in the opposite direction? Try to imagine instructing planes to land or takeoff with a forty knot tailwind. And worst of all; try to imagine giving planes "clearance" to take off directly into the path 189.2

of approaching aircraft.

When planes all approach and depart in the same direction all aircraft in flight are in separation envelopes that change slowly. When planes are erating in opposite directions their separations change at two times the locity of each craft. Human nature being what it is suggests that this de of operation would not stand long before it is modified to allow full approach and departure operations to the northwest of the field. 189.2 (cont.)

Opening a new runway will delay our focus on other transportation opportunities. Once we put the idea of airport growth behind us, our public policies can be directed, with full attention toward the new transportation technologies. Even Massport will be turned around. In the end, I believe they will become a strong ally in building a truly modern and innovative transportation system for New England.

Respectfully Submitted,

Brian Culver

189.1	Regional Transportation	Regional Airports	The status quo should be sustained until such time as we have advanced our region's transportation vision for the future.	The Airside Project analysis is based on alternative 20-year forecasts of operations by aircraft type. Only larger aircraft compatible with the existing facilities at Logan Airport are included in the future forecasts for Logan Airport fleets on which the delay and environmental analyses are based.
189.2	Alternatives	Runway 14/32	I believe that the 320 degree approach/140 degree departure scheme is unworkable...Human nature being what it is suggests that this mode of operation would not stand long before it is modified to allow full approach and departure operations to the northwest of the field.	Comment noted.

LETTER 190

April 18, 1999

Mr. Arthur Pugsley,
MEPA Unit
Executive Office of EA
100 Cambridge Street
Boston, MA 02202

Dear Mr. Pugsley,

I am strongly opposed to the construction of the proposed runway 14/32 at Logan Airport.

My house is on Lakeview Avenue in Cambridge. When air traffic passes over this neighborhood (the Fresh Pond end of Lakeview) the plane noise is loud enough to awaken me from sleep and, when I'm outside, conversation cannot happen when a plane goes over. To be expected by Massport to tolerate even more noise is unacceptable. 190.1

Please put me on record as strongly opposed to any runway construction, now or in the future, that would increase air traffic over Cambridge.

Yours truly,
John D. McKernan

LETTER 191

5/11/99

Mr. John Silva
Manager Environmental Programs,
Airports Division ANE-600
FAA - New England Region
12 New England Executive Park,
Burlington, MA 01803.

Dear Mr. Silva,

I am opposed to the Airport expansion as described in the Environmental Impact Statement. The draft has not examined a regional transportation plan. It has not covered the concern of future growth and noise.

Logan Airport does not conform to it's agreements today, - how will this change in the future? 191.1

Noise is my main concern, and I have noticed the problem getting worse. 191.2

Please have MASSPORT/LOGAN Airport take a Regional look at transportation and insist on them following the limits on noise. 191.3

Sincerely,

Ann Rodney
4 Newport Rd #5
Cambridge, MA 02140.

Letter 191

Code	Topic 1	Topic 2	Comment	Response
191.1	Mitigation	Initiatives	Logan Airport does not conform to its agreements today. How will this change in the future?	Massport's mitigation measures are reinforced through compliance with M.G.L. Chapter 30A, Section 61 and through specific state and federal certificates approving projects that have mitigation. The status of the Section 61 Finding commitments are tracked and reported in the Logan Airport *1999 ESPR* (previously GEIR).
191.2	Noise	Impacts	Noise is my main concern, and I have noticed the problem getting worse.	The Airside Project Draft EIS/EIR shows that the total noise impacts around Logan Airport will improve in the first decade of the 21st century, primarily from the elimination of the noisier Stage 2 aircraft, and by the gradual elimination of the hushkitted Stage 3 aircraft as they are retired.
191.3	Regional Transportation	Regional Airports/ Passenger Rail	Please have Massport/Logan Airport take a regional look at transportation ...	Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Re: Logan Airside Project, Boston MA.
EOEA # 10458

Dear Sirs,

I am writing to give my comments on Massport's proposed Logan Airside Expansion DEIS/R. I urge that you reject the DEIS/R as inadequate, and require a resubmittal of a DEIS/R. based on a revised and updated scope to reflect current information, in order to provide the public a reasonable basis for comment. The DEIS/R overstated the number of passengers who will use (or will be able to access) Logan's airfield by the year 2010, and therefore exaggerates the problem of airfield related delay; does not analyze and therefore ignores the problems of terminal related and ground access related delay; underestimates the potential benefits of peak pricing in reducing airfield delay; ignores other means of reducing excessive use of the airfield by regional non- jets; substantially underestimates the adverse noise impacts that would result if runway 14-32 were built; shows that the delay reduction benefits of runway 14-32 are likely to be eliminated by growth in utilization slightly over 5 years, but fails to analyze the danger that

the problem of airfield related delay; does not analyze and therefore ignores the problems of terminal related and ground access related delay; underestimates the potential benefits of peak pricing in reducing airfield delay; ignores other means of reducing excessive use of the airfield by regional non- jets; substantially underestimates the adverse noise impacts that would result if runway 14-32 were built; shows that the delay reduction benefits of runway 14-32 are likely to be eliminated by growth in utilization slightly over 5 years, but fails to analyze the danger that the provision of F 14-32 might actually worsen delay by locking in the inefficient non- jet regional aircraft structure that utilizes 40% of the airfield capacity for 10% of the passengers. It fails to properly carry out the environmental justice process or the section 4(f) analysis; misinforms the legal status of decision heights or runway analysis; fails to analyze alternatives to the proposed taxiway; and generally seems designed to "sell" one outcome rather than present balanced information for public comment. The cumulative impact of these distortions are such that the most reasonable conclusion, which I believe is to drop runway 14-32 and the taxiway and focus instead on terminals, transit ground access, incentives to consolidate regional non-jet operations, and renewed commitment to noise abatement is obfuscated.

The draft EIS is so defective in presenting information for intelligent reaction and comment, and the outreach to affected communities has been so defective that it does not meet reasonable standards to be considered as acceptable draft, and therefore deprives the community of a reasonable opportunity to affect the decision.

The primary deficiencies are:

1. The Massport proposal claims it is necessary to add airfield changes, including new runway 14-32 in order to avoid dramatic growth in delay that will otherwise occur when Logan passengers rise from the current 28 million figure per year to 37 million to 45 million by 2010. But,
   - Not withstanding the analysis in the DEIS/R of regional airport, high speed rail, and telecommunications improvements that can account for diversion of up to 7.3 million passengers per year, the DEIS does not adjust the "37 million passenger to 45 million passenger by 2010" estimate to reflect any adjustment to recognize the effect of the regional airport and high speed rail initiative underway. In addition, assuming that the recently announced Massport adoption of Worcester Airport is effective and achieves the 50% capture rate assumed for Manchester, an additional 1 million 2010 passengers will be diverted away from Logan, and the introduction of Rail Service to Green should be expected to shift the service area boundary between Logan and Green, diverting at least an additional 1 million 2010 passengers from Logan. Factoring in just the committed regional aviation and high speed rail improvements, and discounting the more conjectural

192.1

teleconferencing projections, the 2010 passenger predictions should be adjusted to 29 million to 37 million, that is, passenger growth of 0 to 8 million at Logan between today and 2010. This dramatically affects the projection of increasing delays at Logan, in particular over the next 5 years when the "hassle factor" of contending with "big dig" and Logan construction will coincide with improving service at Manchester, Green, Worcester, and high speed rail service to New York. The entire bases of the DEIS/R is flawed by this failure to include any adjustment in passenger demand projection at Logan for 2010 to reflect the regional airport and regional rail programmed improvements, and a new DEIS must be prepared to provide a meaningful set of projection to consider. 192.1 (cont.)

- The Massport report contains no analysis of how 35-50% more passengers can get to Logan or through the terminals, when the parking spaces are limited by the Clean Air Act "parking freeze", and transit improvements that were proposed at the airport Blue Line Station and a high-capacity people mover have been abandoned by the state and Massport and the terminal A rebuilding plan has been stuck for years and will have lower capacity during reconstruction. Regional EPA proposed in 1995 that airfield studies should be included in a comprehensive analysis of access to Logan and the capacity through the terminals. Recent events since the "scope" of the study was set in 1995 have proven that the EPA was right. It is not at all clear that many more passengers can get to Logan or through the terminals. In any case, it is absolutely essential that a new draft EIS be prepared that includes a comprehensive analysis of access to Logan, as well as terminals, to evaluate the airfield proposals intelligently. 192.2

- The Massport document shows in figure 1.5-8 that overscheduling of flights at Logan decreased from 1993 to 1998, presumably resulting in reduced delay, but there is no information about actual delay at Logan during this period; only computer predictions about increased delay in the future. But if airline consolidation within the regional carriers has produced a modest reduction in overscheduling, as suggested in the Massport DEIS/R, how has this affected delay and could further consolidation of regional flights produce further reduction in delay? 192.3
- The consultants to the Community Advisory Committee to Massport(CAC) believe that delay has decreased substantially and cite FAA-produced data as evidence. If Massport had continued to dialogue with the CAC, instead of cutting off communications and shifting to a media strategy, there might be credible information on the table. At this point, for a proposal with major adverse impact because of increased overflight in our communities (at least triple), there is precious little real data about actual delay as defined by FAA. There is not adequate information about delay to allow us to comment intelligently. 192.4

2. The noise information presented is so questionable that it needs to be revised into a new draft, to provide a reasonable basis for public involvement.

- The DEIS/R uses computer projections of noise, but the computer projections consistently understate actual noise as measured by Massport over field microphones. 192.5

This problem has been called to the attention of Massport for at least 3 years, but the DEIS/R is based on the inaccurate computer projections and needs to be redone.

- The tripling of overflights predicted actually understates the shift in operations that will occur given the long experience with FAA control tower ignoring the PRAS whenever delay exists. Given Massport's projections of increased delay within 5 years, the utilization of runways 15/33 and 9/27 is likely to more than triple. The lack of analysis of this actual increase in overflight likely makes the noise predictions further understated. 192.6
- Land Use and Coastal Zone Impacts and Smart Growth are ignored- the DEIS ignores the impact of increased overflight, (by a factor of at least 3!) on currently underutilized land in the Seaport district of Boston, and in Chelsea, Everett and Somerville. Because of enormous public investment in the Boston Harbor Clean Up, the Big Dig, and the Urban Ring Transit Project under planning, these formerly underutilized areas are poised to play major roles as centers of "Smart Growth", and benign and compatible uses of the coastal zone, but the Massport DEIS/R ignores this issue. 192.7
- The entire analysis assumes that Runway 14/32 will be used only in overwater approaches and departures, but Appendix I indicates that US statute makes that decision solely the province of the FAA. Such decision must comply with N.E.P.A. But there is no guarantee that even a full EIS would be required to use the runway in both directions. Any interference with the two-way operations of Runway 14/32 posed by the Hyatt Hotel could be removed with the collaboration of Massport. Given recent decisions by Mass Highway and FHWA to reverse commitments made in the 1991 ?SFEIS? for the Central artery/Tunnel project, eliminating commitments to improve transit and substituting 36' high and 53' high highway ramps for highways that were promised to be at or below 192.8

grade, there is no basis for confidence that the runway will be unidirectional. The DEIS/R contains no analysis of the noise and safety impacts on Jeffries Point, East Boston, Charlestown and Beacon Hill that would be caused by two-way operation of Runway 14/32. Failure to disclose the potential impact, and the lack of any disclosure of credible guarantees on this matter is a substantial flaw that requires that the draft EIS/R be rejected as inadequate. 192.8 (cont.)

- The DEIS/R uses 1999 simulated information as the basis of comparison for predicted year 2010 impacts in a variety of scenarios. But the choice of 1999 makes comparisons confusing. The primary Massport strategy to reduce overall noise impact over the past decade has been to require the airlines to use higher proportions of Stage III, less noisy, jets. The federal law requires the phaseout of all non-State III Aircraft by the year 2000, so certainly Logan, with its stricter noise rule should be all Stage III Aircraft by the year 2000. This noise abatement program was committed in the 1980s, as mitigation for the increased frequency of overflight that would occur as flights more than double in frequency(if accurate measurement of noise contours actually experienced in the community had been in practice, Massport might actually have achieved this level in advance of the year 2000.) The benefits of all Stage III aircraft is a long-awaited mitigation of increased frequency that Logan's neighbors are entitled to. For this reason, the 1999 simulation should be run with an all stage III fleet, in order to understand the true impact of the various alternatives, and should be used in particular to identify section 4(f) impacts, for all park and historical resources currently affected by Logan or potentially affected. Because of the failure to identify the 1999 all Stage III exposure, the 192.9

basic analysis of Section 4(f) impacts and noise comparison among alternatives is seriously in error, and the draft EIS/R substantially flawed, and should be withdrawn.

3. The DEIS does not explore a reasonable range of alternatives.

- Massport owns Hanscom Field, an existing airport adjacent to Rte. 128, but no analysis is done of the potential share of commercial activity that Hanscom might absorb, and the net environmental impact on the Hanscom environment if military and General Aviation Activity were displaced. The potential sitare of traffic is likely to be substantial, since Hanscom is better situated for much of the suburban and Rte. 128 market than either Manchester or Green, so a substantial share of the market now using Logan would seem to be potential. With no analysis of this alternative, the draft EIS/RIR is substantially flawed and should be viewed as an inadequate basis for comment. 192.10

- The overutilization of Logan airspace by regional carriers who use 40% of the airspace to accommodate 10% of the passengers is the central problem driving delay at Logan, but the only option explored to deal with this is a very weak form of peak pricing, with a very high "trigger" of 110 movements per hour. No sensitivity analysis is presented, to explore the impact of different "triggers" set at 105,100 or 95 movements per hour. Also, the analysis methodology assumes that flights may move out of the peak, or be eliminated, but does not explore the possibility the flights will be consolidated into a smaller number of larger aircraft. For this reason the analysis both understates the delay reduction potential of this method and overstates its economic impact. No analysis of 192.11

"grandfathering" or "exemptions" for special circumstances is presented, resulting in an exaggerated prediction of economic impact, and a very distorted analysis. The likelihood that even a weak form of Peak Pricing would tend to preclude the high delay "high" scenario is not even mentioned, even though the delay avoidance benefits of the Low vs. High scenario are greater than the differences among the alternatives considered. Since Peak Pricing will tend to inhibit the profitability of redundant regional services, it seems likely that the Peak Pricing would preclude the High Scenario from occurring, and that it should be tried before any of the construction scenarios. The availability of "baby" 15-L-33R and 4L-22R for modest numbers of small aircraft movements to accommodate "exceptions" and "grandfathering" would seem to make such a scenario quite attractive, but the basic analysis is not presented in this draft to evaluate this, so once again the draft EIS is fundamentally inadequate and should be withdrawn. 192.12

- Other alternatives to control overscheduling such as "slotting" Logan at a reasonable number of movements per hour, using market measures to distribute the "slots" are not evaluated whatsoever. 192.13
- Use of limited priority based on size of aircraft to reduce the impact of airfield delay is not considered. Limited prioritization of takeoffs based on size would seem to be a very straightforward way to minimize the impact of delay on passengers and equipment utilization, and sensitive connecting flights. Already existing "Gate-hold" Procedures could be modified to incorporate the same principle for landings, but this possibility is not explored. 192.14
- Simple "jawboning" of regional air carriers is a technique that might have substantial benefit, especially if accompanied by phase-in of Peak Pricing or lease restrictions to 192.15

encourage movements toward an all-jet Logan. This possibiolity is not evaluated at all. 192.16
The effectiveness of the P.A.C.E. program in 1988 is not described or evaluated.

- There are no alternatives considered to the centerfield taxiway proposal. It would appear that the threshold of runway 4L-22R could be displaced substantially to the south, in 192.17 order to iucrease the height of aircraft landing over the Bayeswater St. neighborhood, reducing noise and increasing safety margin. Since over???to ??? from the north are ??? to small aircraft on runway 4L-22R, it should be possible to displace the threshold substantially to the south, and allow aircraft landing on 4R to "turn early" across the inactive northerly remnant of 4L-22R. This displaced threshold should permit consideration of higher blast fence to protect the Bayeswater neighborhood, and the Constitution Beach. It should be possible to consider replacing taxiways November with 192.18 a buffer ?? to protect the beach. Since the entire premise of the Massport airfield proposal is that the 4-22 runways will be utitlized less, it is not clear why the centerfield taxiway is needed at all, or alternatively why a sanitized northerly ENV of runway 4L-22R cannot serve as the taxiway for the northerly portion in lieu of the "November" taxiway which adversely affects Constitution beach. This could avoid the adverse noise and habitat destructions associated with the northerly part of the Proposed taxiway and "November."

4. The draft EIS/EIR does not respect the Environmental Justice Executive Order.

- The core of the Executive Order, and the DOT implementing order of April 1997, is 192.19 identification of affected populations, with particular identification of minority populations and low-income population, and establishment of communication and interaction,

identification of disproportionate impacts or benefits and of alternatives to avoid or mitigate disproportionate impact. This process was not followed.

- The draft EIS includes 7 pages of discussion which basically asserts that no disproportionate impact exists by identifying the proportion of low-income and minority people affected, after assuming mitigation. The basis of the numbers is not clear(1990 census? 1995 update?) The interpretation that soundproofing can mitigate, so that the impact can be denied is inappropriate. The Executive Order requires a process that identifies impact and communicates with affected people to consider alternatives. Mitigation such as soundproofing is appropriate to ameliorate unavoidable impact, it is certainly never complete, and should not be used to deny the impact in the first instance. Also, there is no disclosure in the draft EIS of how soundproofing can be achieved in low-income housing units where the structure may have other building code problems, and owners may lack access to financing and rent levels, and therefor financial resources, are constrained by low-income. It took a decade to get the Logan soundproofing program working reasonably for middle class homeowners. There is no discussion of the kind of program that would be required to make it work for non-owner occupied low income housing.

192.20

192.21

192.22

- There is more discussion of the economic impact of Peak Pricing on Cape Air, and prediction of difficulty of access to Nantucket, Provincetown and Martha's Vineyard than there is in the entire Environmental Justice section!!

192.23

- The analysis of differential impact should be *comparative.* Alternatives such as Hanscom Field or Peak Pricing are likely to have NO adverse impact on low-income or minority populations. Moreover, low income people, who are less likely to fly, are less likely to

192.24

benefit from any reduction in delay. But there is no comparison of alternatives based on environmental justice concerns.

- Whatever an appropriate decision might be *after* Environmental Justice consideration(it is possible that the FAA and Massport might choose alternatives with high Environmental Justice impacts after full consideration). The Executive Order and DOT implementation order are clear that Environmental Justice principles are to be considered at the earliest possible point in the process and occur before decisions are made. That has clearly not occurred in this draft EIS and on that basis alone the DEIS/R is inadequate and should be withdrawn. 192.25

5. The television and radio(and newspaper) advertising program by Massport constitutes a major flaw in the environmental process and a violation of environmental justice and in and of itself requires a withdrawal of the draft EIS/R. 192.26

- The topic of airfield delay and alternatives to deal with it is a very complex subject. The television and radio advertisements oversimplify and distort this complex issue. Television and radio are difficult means to communicate complex public policy issues in any event, but the Massport advertising initiative makes no attempt at a balanced presentation. There is no disclosure that the Runway 14/32 will cause substantial increase in overflight of some communities, there is no identification of alternatives. The entire communication of the draft EIS is imbalanced, leaving out important information and analysis. But the radio and TV advertisements, which are heard by many more people than read the Draft EIS is a totally biased "sales pitch" which makes no pretense at balance. Quite apart from the

appropriateness of a public agency engaging in paid media communication, in coordination with private interested parties, the biased and unbalanced nature of the communication further flaws an already inadequate and imbalanced draft EIS. It must be emphasized that the expense of such communication is totally beyond the financial capacity of the low and moderate income communities adversely affected by the runway proposal and constitutes another violation of Environmental Justice principles. The advertisements also appear to be available only in the English language despite a significant Latino population in the impacted area.

Comments on the Logan Airside DEIS/R SCOPE

The DEIS/R is so deficient and misleading that it should be rejected and "rescoped" in order to provide a document adequate for public comment and interaction to serve as a draft. 192.27

The most serious scope deficiencies are:

(1) The scope of the document was established in 1995, over 3 years ago.

(2) The DOT Implementing Order for the Executive Order on Environmental Justice was issued April 15, 1997, and requires identification of low-income populations and minority populations; consideration of disproportionate impact, consideration of alternatives and mitigation and adoption of practicable alternatives to mitigate. Environmental Justice principles are to be applied at the earliest possible time. These procedures were not followed (even though the Executive Order itself dates from 1994, and the DOT order has been available since April 1997). The only way to remedy the substantial flaw in process is to begin again. 192.28

(3) The scope of the study is much too narrow.

a) It focuses on airfield delay caused by northwest wind. Since by Massport information the northwest wind problem causes approximately 20% of airfield delay, and the remainder of airfield delay will grow to exceed current airfield delay within 5 years, this is much too narrow a problem definition to be serious, and appears to have been selected to predetermine a conclusion to build Runway 14-32. 192.29

b) Even all airfield delay is too narrow a problem definition, as it concentrates excessively on the airfield, to the exclusion of delays caused by deficiencies in the terminal 192.30

configuration. There is no information in the DEIS/R on the question of all delay caused to landing aircraft waiting for a gate, but this appears to be a growing source of delay.

c) The definition of airfield delay does not include analysis of delays caused by small aircraft in the fleet mix. The FAA safety procedures require increased separation when significantly different aircraft follow each other, affecting capacity and causing delay. There is no consideration of this issue, nor is any time dimension placed on the differential time required in transit by the current practice of using non-jets in regional markets. This industry practice appears to be changing in response to customer preference, and analysis of the comparative time in transit could provide insight into the likelihood of major changes in the regional fleet, which now utilizes 45% of the airfield capacity to accommodate 10% of the passengers, according to the information in the DEIS/R. The DEIS/R does not include analysis of the constraint imposed by differential size. 192.31

d) There is no analysis of the potential restructuring of regional air travel, as small jet services make direct flights from Green, Manchester, Portland and other regional airports more attractive than the indirect service of regional carriers to Logan to transfer to other flights. Understanding the potential substitutability of these more direct flights could provide more insight into aircraft movements required to accommodate regional demand, over the next 10 to 15 years. 192.32

e) Even all aircraft delay is too narrow a scope, focusing excessively on the interest of efficient utilization of aircraft. Passenger delay includes delay in processing ticketing and baggage for both emplaning and deplaning passengers. These delays are caused by terminal design constraints and personnel schedules, and increase with congestion in utilization of a given terminal configuration. If the typical passenger follows information to arrive 2 hours in advance, 192.33

these delays clearly involve more passenger hours than the airfield-related weather delays, but they are borne by the passengers, not the airlines, and are not analyzed in this DEIS/R.

f) There is no analysis of passenger delay in accessing Logan on the metropolitan area road and transit system. This system is congested, parking at Logan is limited by the Clean Air Act parking "freeze", and improvements in public transport access are lagging. This factor affects passenger and cargo delay and reliability, and appears to be affecting consumer choices to use Manchester or Green instead of Logan. Since over 50% of Logan passengers originate outside of Route 128, understanding this market is essential to understanding Logan's future. 192.34

g) Regional EPA proposed in its scoping comments of 1995 that a comprehensive analysis of the airport, including the (metropolitan) ground access and terminal capacity and its interrelationship with any airside proposals should be included. Unfortunately, the DEIS/R ignores the need for a comprehensive approach, and refers the reader to the Generic EIR, a state document which, among other problems, deprives citizens of protection of federal laws such as the NEPA requirement to analyze socioeconomic as well as environmental concerns, Title VI (Civil Rights), Section 4(f), and the Executive Order on Environmental Justice. 192.35

h) At the time the scope of the DEIS/R was developed, Massport was proposing a "People Mover" to substantially improve transit access to the Blue Line, and the CA/T project was committed to a major upgrade in the Blue Line Airport Station, including cross-platform transfers in both directions. Now Massport and Mass Highway have withdrawn these commitments, giving rise to the question, "How on earth can Logan handle 50% to 100% growth in passengers with a parking freeze and no significant transit improvement in sight?" This is a fundamental change since 1995. 192.36

i) In 1995, the Port Authority was talking about redeveloping Terminal A through a "privatization" mechanism. Today they have apparently concluded that will not succeed, but there is no clear timetable for the redevelopment of Terminal A, the most prominent terminal at Logan, and the most problematic. While that terminal is being redeveloped, the capacity to handle passengers will go *down* unless a successful mitigation strategy can be developed. Terminal A was to have been redeveloped with a shape designed to buffer noise impacts on the nearby Jeffreys Point neighborhood. In addition, and with no increase in number of gates, rumors indicate that Massport now intends to abandon the noise buffer shape, and add gates. This would constitute "segmentation." A revised scope should include Terminal A redeveloped including any options. 192.37

j) At the time of the scoping (1995), Massport's consultants had developed computer models to predict aircraft movements based on data from 1993, the worst year for delay caused by excessive scheduling of redundant regional commuter services. Most of the projections in the DEIS are based on these projections. The DEIS concedes that airfield delay at Logan actually went down since 1993, but there is no effort to analyze what happened, much less to correct the computer programs to incorporate this in forecasting. This rendered the projection of air movements questionable as well as the resulting predictions of the effectiveness of peak pricing in reducing delay. Realistic air traffic predictions require an open review of the actual data to develop an understanding of what is happening, in order to produce more reliable methods to predict future conditions. 192.38

k) Overflight of parts of East Boston and Chelsea affected by Runway 15-33, and of South Boston, the South End, Jamaica Plain and Roxbury affected by Runway 9-27 is predicted to triple (based on the computer models which include "PRAS" goals if Runway 14-32 " is

available. However, experience shows that during delay conditions the FAA controllers ignore PRAS goals and utilize maximum capacity configurations, so the tripling of exposure to overflight predicted with availability of Runway 14-32 actually *understates* the likely reality. More realistic utilization estimates should be prepared, at least to provide a range of estimate. 192.39

l) Noise impact from aircraft is projected in the DEIS by using computer models, but citizens have complained for years that the noise levels measured by Massport microphones monitored in the field show that actual noise consistently exceeds the predicted levels. Since the computer's predictions are used to decide on the need for airlines to improve the fleet (by replacing noisier aircraft with quieter ones under Massport noise rules), and to decide on eligibility for soundproofing, this is a very important fundamental flaw. In addition, these same models are used to predict noise consequences of the airfield proposals, so the predictions in the DEIS/R understate actual impact. The computer models should be adjusted to better simulate actual noise impacts. 192.40

Moreover, MEPA requested the preparation of 60dB contours, as well as 65, 70 and 75, but this information is not included in the tables in the main report. (There is some information in the appendices for those with the patience to find it.) 60dB contours should be prepared (using consited models) and used in the analysis. 192.41

m) Credibility of environmental commitments has been undermined by Mass Highway reneging on the Airport Station Blue Line commitments. In addition, the Mass Highway revisions constitute a segmentation flaw in the airfield project. The Mass Highway proposal should be suspended, and it and suitable alternatives incorporated into the revised scope. 192.42

In short, based on these multiple flaws, the DEIS/R scope is so out of date as to be meaningless. It should be withdrawn and a new scope developed, consistent with Environmental Justice principles. 192.43

Additional Observations on the DEIS/R, and Scoping Revisions Required:

1) The central problem with airfield capacity is the fact that it is overutilized, as always occurs at facilities in attractive locations unless they are managed through regulation or pricing. Because of a variety of wind and weather conditions, reliability of Logan is much higher at frequency of less than 100 movements per hour, whereas it becomes very unreliable as utilization approaches the maximum capacity of close to 120 movements per hour. Yet the DEIS/R does not provide basic information to identify the reliability of Logan at 75, 85, 95, 105, 115 movements per hour so that the trade off between frequency and reliability can be understood. The 1993 SAR report by Arthur D. Little rates the practical capacity of Logan at 95 movements per hour, and the FAA rates its practical capacity at 93 movements per hour. 192.44

The further fundamental issue at Logan is the fact that approximately 40 percent of the airside capacity is used to accommodate small regional non-jets which carry 10 percent of the passengers, (and a large proportion of the regional passengers are just passing through to other destinations.) If substantial consolidation of regional flights could be achieved, Logan would operate at or below 100 movements per hour and be highly reliable. 192.45

Recognizing this fundamental problem of misutilization of available runway capacity, and the tradeoff between overscheduling and reliability, it should be possible to accommodate substantial increase in passenger service without any airfield expansion. Over the past 20 to 25 years Logan has grown from 8 million passengers per year to over 26 million, with no airfield modifications of significance, because of improvement in technology and increased jet size. Since adoption of the "no increase in environmental impact" policy agreed to in 1987 in the context of the environmental impact studies on the third harbor tunnel, Logan has stayed within the 1987 noise contour, showing that minor increases in passenger volume can

be accommodated on the Logan airfield without increased delay and unreliability *and* without increased noise impact in surrounding communities. In order to encourage the better utilization of Logan runways, six basic strategies are possible:

A) A Clear Policy of No Airfield Action. The overscheduling problem is clearly caused by airline scheduling practice. It also costs the airlines a lot of money, because of inefficient utilization of aircraft, and hurts the image of airlines with customers. The primary cause of current delay is the overutilization of small non-jet aircraft in the regional carrier market, but there is some tendency for more comfortable, faster, and larger "small jets" to be increasingly used in these markets in response to customer preference and changing airline market relationships, so there is some likelihood that a message to the airlines that runway 14-32 is off the table definitively would lead the airlines to resolve the runway overutilization problem on their own without any other action by Massport or FAA.

192.46

B) Option 1 could be supplemented by a "jawboning" approach with the airlines to schedule more realistically.

C) Option 1 could be complemented by reform of landing fee structure to move toward peak pricing, giving some market incentive to encourage rationalization of the regional feeders.

D) Option 1 could be complemented by delay management strategies to prioritize larger aircraft over smaller whenever delay conditions exist, thereby minimizing the impact of delays on the largest number of people and the most expensive aircraft, and also sending a strong signal to the airlines encouraging a shift to jet operations.

E) Logan could set a goal of becoming an "all jet" airport by a date certain, giving a period of time for adjustment followed by a policy of priority for jets on takeoff whenever delay exists.

F) Logan could become a "slotted" airport, with schedules constrained to no more than 95 movements per hour, and a periodic auction mechanism to avoid the anticompetitive aspects of "slots" in other cities, and in Europe.

The DEIS explores only peak pricing among these options, and appears to design it in order to fail, with the peak defined at 110 movements per hour for three successive hours, a level of activity so high the effect on the system should not be expected to be significant.

Moreover, the analytical approach to analyzing the peak pricing seems totally flawed. The DEIS/R hypothesizes a high fleet and low fleet scenario, based on a high and low passenger forecast, and then uses a model to predict schedule shifts out of the peak period and in some cases elimination of flights. But it ignores the fact that the existence of even a weak peak pricing system would inhibit the "high fleet" scenario from developing at all, since it would decrease the profitability of redundant regional services, encourage higher load factors, and, over time, shift to small jets at lower frequency. None of these effects are evaluated, but the differences in delay between high fleet and low fleet scenarios are greater than the differences in delay between the "with" and "without" Runway 14-32 within a given scenario. This leads to a conclusion that the introduction of even a weak form of peak pricing should occur immediately as suggested by EPA in 1995, so its effects can be evaluated and fine

192.47

tuned. The DEIS fails to report on the performance of the PACE program which was tried with some success in 1988. 192.48

The fact is that the current landing fee system is indefensible, except as a relic. It is unrelated to the opportunity cost of using the runway and subsidizes inefficient aircraft to the detriment of the vast majority of passengers.

2) The noise analysis is inappropriate, systematically understating the likely average noise impacts of the introduction of Runway 14-32. While the DEIS predicts a tripling of 192.49 overflight in Chelsea and East Boston, Somerville, and South Boston, South End, Roxbury and Jamaica Plain; the model is constrained by PRAS goals. But experience has shown the FAA control tower will ignore PRAS goals whenever there is congestion, so even greater increases are likely.

In addition, the computer generated noise contours understate noise as measured in the field.

Even ignoring the understatement, the addition of Runway 14-32 clearly increases the noise affected population, and thus violates the 1987 environmental cap, and should be rejected on that basis alone. 192.50

In addition the DEIS attempts to obfuscate the noise impact by focusing on 75 DB contours rather than the 65 used by FAA or the 60 suggested by MEPA. But the households within the 75 DB contour shrink in all scenarios because of fleet improvement, as the category II aircraft are replaced by the less noisy category III aircraft, and all of these affected households have been soundproofed. Based on the Massport theory of mitigation, the already soundproof homes within the 75 DB contour will experience some relief from the fleet improvement. It is the increase in exposure of households in the 60 DB contour who

represent the most significant worsening of noise conditions, without soundproofing, but these numbers are not calculated, and the 60 DB contours are hidden in an Appendix. 192.51

The benefit of compliance with the PRAS is exaggerated in the DEIS/R. The PRAS was a negotiated agreement 25 years ago. It is a way to share basically unreasonable amounts of noise. It is not really so significant as reducing noise by improving the fleet mix through retirement of the noisiest aircraft, or minimizing the number of households within the 60 DB contour.

In addition, the selection of 1999 and 2010 distorts the comparisons, since the phasing out of all Stage III aircraft is due in 2000, and make it more difficult to understand the effect of various proposals. Including a 2001 analysis would separate this effect.

In any case, the measurement of noise should be improved in order to enforce the fleet noise rule more aggressively, and in order to more fairly implement the soundproofing and other mitigation strategies, and more realistically estimate impacts. (However, it is clear even from the inadequate analysis of the DEIS/A that the Runway 14-32 would have substantial adverse effect, violates the 1987 no increase in impact policy, and should be rejected.) 192.52

3) Analysis of the Reduction in Landing Minimum s is Misleading and Inadequate

The landing minimums on Runway 15 and 22 were deliberately held high pursuant to agreements with the city of Boston. The community's objective in negotiating these higher than normal decision heights was to discourage use of landing over populated areas during low visibility conditions, and to encourage instead the use of overwater approaches during low visibility conditions, by installing Category III instrument landing systems, with the lowest decision heights on the 4R and 33L overwater approaches. The DEIS does not accurately describe the reasons for the agreements, or even the fact that the city of Boston 192.53

has contractual rights in this matter. Worse yet, Category III ILS has yet to be installed on Runway 33L. The DEIS/R predictions of improvement of reliability during low visibility conditions is not disaggregated to identify the benefits attributable from improved instrumentation on runway approach 33L which the community supports, as distinguished from the decision height reductions on runway approach 15R and 22L, which the community opposes. In addition, the community has always understood that low visibility conditions generally occur under low wind conditions, but the DEIS/R implies that wind direction is a factor in this proposal. No identification of the frequency of high wind/ low visibility conditions, or data, is presented. Finally, the community concern with low visibility landings over populated area is with safety, and the anxiety caused by such operations in the residential population, but the DEIS/R treats it as a simple noise problem. 192.53 (cont.)

4) The analysis of the taxiway proposals is inadequate. Since the primary taxiway proposal is the taxiway proposed between the 4-22 parallel runways, and since the DEIS/R states that the intention of the package is to *reduce* utilization of the 4-22 runways, it is difficult to understand what delays are proposed to be alleviated. Since the taxiways will increase noise exposure in the Bayeswater section of East Boston and Winthrop, this is controversial, and inadequate explanations of its purpose is presented to allow for intelligent comment. Including the alternatives such as sanitizing the Northern End of Runway 4-22R, and using it as a taxiway should be included in a revised scope. 192.54

5) There is no analysis of metropolitan ground access capacity or terminal capacity to shed light on the feasibility of the 37 million and 45 million passenger projections. With the current parking freeze and no coherent strategy to improve transit, it is difficult to see how even 37 million passengers can reach Logan. The current terminal capacity does not appear

capable of processing appreciably more than current passenger levels. Whenever Terminal A is redeveloped it will probably *lose* capacity during the construction process, but possibly add capacity once it is complete. But there is no analysis to show what number of passengers will be able and willing to access Logan over the next decade so the air service needs can be verified, and the timing of improved access to Green Providence via rail, and high speed rail to New York can be evaluated in the light of more severe growth and terminal access problems at Logan. The missing information is fundamental to make informed choices at Logan. 192.55

6) The appendices on the history of Logan airport are totally lacking in explaining the history of the residential communities around Logan and their interaction with Logan growth. Some basic facts which are necessary to understand the socioeconomic context of Logan should include:

A) The fact that the residential communities predate the existence of the airfield.

B) The major community disruption caused by construction of the Sumner Tunnel.

C) The community disruption caused by the Blue Line extension.

D) The destruction of Wood Island Park caused by expansion of Runway 15-33.

E) The destruction of the Neptune Rd. neighborhood by the combination of increased noise, instillation of the ILS localizer, and the (positive) relocation of houses to the Horace St. area. 192.56

F) The destruction of Amerena Field to expand the airport cargo area and build the (now vacant) post office area.

G) The crash landing of a small plane on the porch of the home of Senator LoPuesti of Bayeswater Street, and the subsequent limits on the use of Runway 4L-22R.

H) The massive trucking on Maverick St. caused by filling the Bird Island flats, the community reaction to the trucks and the development of the internal airport truck route and gating of Porter St. and Maverick St. to control airport related traffic.

I) The gridlock conditions on the airport exit roadway which led to the variable message egress control system to manage the problem, and the growing Day Square traffic.

J) The development of the 1975 master plan and generic EIR process, and the "parking freeze" at Logan.

K) The installation of improved ILS systems on runway approaches 15R and 4L, and the restrictions on decision height agreed to by FAA and the Mass. Port Authority.

L) The development of Porzio Park and the development of the Bird Island Flats cargo area, with the harborside park.

M) The environmental process for the Ted Williams Tunnel, the commitment to a cap on environmental impacts at or below 1987 limits.

N) The implementation studies to implement the 1987 environmental CAP (improved parking freeze, Logan noise rules, Logic study, LADS study, and LAMP study, P.A.C.E. Program. Establishment of CAC.)

O) The commitment to improve transit interface between the airport bus and Blue Line at Airport Station, with cross platform transfer in the 1991 SFEIS of the Central Artery/ Tunnel Project.

P) The initiation of Logan Express services, water shuttle.

Q) The increased relationship with Chelsea for airport-related activity.

R) The commitment to an airport edge buffer park. (not implemented to date)

S) The 1993 Massport-Air Inc. mitigation contract.

T) The Waterfront Park at Marginal St., Jeffries Point section of East Boston.

V) The lawsuit on non-performance of the 1993 agreement.

W) The 1997 mitigation agreement.

7. Given the reliance on environmental commitments in the proposed Runway 14-32, a list of "broken promises" that undercut the credibility of such assurances is worthwhile.

A) Airport Blue Line station (CA/T Commitment, but Massport did not defend the honoring of the commitments to cross-platform transfers and at- or below- grade highways, when Mass Highway removed the Transit improvements and substituted very high (36' and 53' high) highway ramps.) 192.57

B) Airport buffer edge (not implemented)

C) Free shuttle to South Station, added Logan Express service, PeopleMover to Blue Line to increase capacity by a factor of six (now broken).

D) Flight tracks and PRAS

E) Landing decision heights in bad weather

F) Taxiway use regulation to restrain noise exposure at the northern end of the 4-22 runways.

G) The blast fence at the northern end of the runway 22R, which Massport intermittently proposes to remove.

8) The Section 4(f) presentation is substantially flawed and a revised analysis should be required in a new scope. Specifically all Section 4(f) resources affected by current operations or proposed actions should be identified. Their noise exposure today and in 2001, within all Stage III fleet should be identified, to establish a new "Base Condition" based on existing regulation, and the 192.58

impact of various proposals upon 4(f) resources identified. In addition, analysis to identify "all flexible planning to mitigate adverse impact should be carried out and presented.

9) A revised DEIS/R scope should carry out an analysis of impacts on coastal zone and smart growth land resources in the South Boston Seaport area, Chelsea, Everett and Somerville. 192.59

192.1	Analysis Assumptions/ Methodologies	Passenger Forecasts	The 2010 passenger predictions should be adjusted to 29 million to 37 million...to reflect the regional airport and regional rail programmed improvements	The Airside Project analysis considered the benefits and impacts of alternatives against a broad range of current and potential future activity levels at Logan Airport. A benefit of this approach is that the findings and selection of the Preferred Alternative (Alternative 1A) were not dependent on a specific future condition, but reflect consideration of different scenarios. The analysis of comparative benefits for the alternative airside projects focussed on activity levels at 29 million and 37.5 million annual air passengers with different possible fleet scenarios. These activity levels reflect probable near- and long-term conditions and include diversion of up to 7.3 million passengers that could be accommodated by regional alternatives. The activity levels and the corresponding benefits and impacts of the proposed improvements were central in the selection of the Preferred Alternative.
192.2	Analysis Assumptions/ Methodologies	Passenger Forecasts	... report contains no analysis of how 35-50% more passengers can get to Logan through the terminals, when the parking spaces are limited by the Clean Air Act "parking freeze," and transit improvements that were proposed at the airport Blue Line Station and a high-capacity people mover have been abandoned by the state and Massport and the Terminal A rebuilding plan has been stuck for years and will have lower capacity during reconstruction. It is not at all clear that many more passengers can get to Logan or through the terminals. ...it is absolutely essential that a new draft EIS be prepared that includes a comprehensive analysis of access to Logan, as well as terminals, to evaluate the airfield proposals intelligently.	In January 2000, the FAA called for a Supplemental Draft EIS and a special panel review process. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The impact of the passenger activity levels, analyzed in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR, on ground access patterns was studied and reported in previous GEIRs. The GEIR and its Updates are specifically incorporated by reference in these environmental review documents as background documents. The groundside impacts of the parking freeze, the Blue Line Modernization project, the AITC, which replaces the people-mover project, and the new Terminal A development have been analyzed in the *Logan Airport 1999 ESPR* (ESPR) (previously GEIR). The ESPR was filed on December 15, 2000.The ESPR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Supplemental DEIS/FEIR. Each ESPR submission is subject to public review and comment. Consistent with past practice, Massport expects that the FAA will take the ESPR analysis into account during its deliberations and decision on the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
192.3	Delay	Model	... flights at Logan decreased from 1993 to 1998, presumably resulting in reduced delay, but there is no information about actual delay at Logan during this period; ... if airline consolidation within the regional carriers has produced a modest reduction in overscheduling, ... how has this affected delay and could further consolidation of regional flights produce further reduction in delay?	The Supplemental DEIS/FEIR presents an expanded analysis and discussion of current and historical FAA delay measures, and additionally quantifies modeled delays at Logan Airport during 1998. Refer to Sections 1.6 and 1.8 of the Supplemental DEIS/FEIR. The delay measures and Massport's modeling both show that Logan Airport continues to suffer from serious airside delays despite the regional carrier consolidation and the decline in regional carrier operations. Regional carrier consolidation did not substantially reduce delays at Logan Airport because airline overscheduling is not a significant cause of delays at Logan Airport. As the Airside Project analysis shows, the lack of a three-runway configuration to handle arriving flights during periods of northwest winds is a major source of Logan Airport delays. Furthermore, the impact of regional carrier consolidation on future delay levels was explicitly examined through the analysis of several future "Low" fleet scenarios, which assume that commuter aircraft comprise a smaller share of Logan Airport's fleet compared to the "High" fleet scenario (new fleet, incorporating a significant proportion of regional jets was also analyzed). Even future Low fleet scenarios show significant levels of delays at Logan Airport. Based on actual experience and the Airside Project modeling, further regional carrier consolidation is not expected to have a significant impact on delay levels in Low fleet conditions. In high fleet conditions, when airline overscheduling is a major contributor to delays, regional carrier flight consolidation reduces delay levels. Massport proposes to monitor airline overscheduling conditions and to seek voluntary schedule adjustments from airlines to reduce delays caused by overscheduling. If airlines do not voluntarily comply, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
192.4	Delay	Model	The consultants to the Community Advisory Committee to Massport (CAC) believe that delay has decreased substantially and cite FAA-produced data as evidence... there is precious little real data about actual delay as defined by FAA. There is not adequate information about delay to allow us to comment intelligently.	Sections 1.6 and 1.8 of the Supplemental DEIS/FEIR describe FAA and U.S. DOT measures of delay and their limitations, including historical data on delays at Logan Airport and other major United States airports, and discusses the estimation and modeling of flight delays. Regardless of the delay measure used, Logan Airport has consistently been one of the most delayed airports in the nation, ranking sixth in total delays and third in arrival delays in 1998. Historically, FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. In fact, delayed flights at Logan Airport, as measured by the FAA, increased by 30 percent in 1998. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994 and now Logan Airport is the third most delayed airport in the United States in terms of arriving flights. Because the FAA and U.S. DOT delay statistics only record historical delays, the FAA requires delay modeling when evaluating the future delay reduction benefits of airport capital improvements. The methodology used for the Airside Project provides a consistent and systematic estimate of flight delays caused by constraints at Logan Airport. The analysis based on this methodology indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels.

Code	Topic 1	Topic 2	Comment	Response
192.5	Analysis Assumptions/ Methodologies	Noise Model	The DEIS/R uses computer projections of noise, but the computer projections consistently understate actual noise as measured by Massport over field microphones.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
192.6	Analysis Assumptions/ Methodologies	Noise Model	The tripling of overflights predicted actually understates the shift in operations that will occur given the long experience with FAA control tower ignoring the PRAS whenever delay exists. Given Massport's projections of increased delay within 5 years, the utilization of Runways 15/33 and 9/27 is likely to more than triple. The lack of analysis of this actual increase in overflight likely makes the noise predictions further understated.	The simulation modeling performed for the Airside Project study analysis considers PRAS only when more than one available runway configuration has sufficient capacity to accommodate demand. There is no basis for the claim that the Airside Project understates the changes in overflights resulting from Runway 14/32.
192.7	Analysis Assumptions/ Methodologies	Noise Model	Land Use and Coastal Zone Impacts and Smart Growth are ignored – the DEIS ignores the impact of increased overflight (by a factor of at least 3!) on currently underutilized land in the Seaport district of Boston, and in Chelsea, Everett and Somerville.	The improvements to be implemented under the Preferred Alternative will reduce delay and enhance the efficiency of an existing airport. The improvements will be constructed on the existing airfield and will support the urban development needs in the area communities and are therefore consistent with Smart Growth policies and Massachusetts Coastal Zone Growth Management Principle #2 (Refer to Section 6.5 of the Supplemental DEIS/FEIR.). The areas that will experience overflights with the use of Runway 14/32 under the Preferred Alternative are the same areas that experience overflights under existing conditions. Flights using overwater routings will increase with the use of the Proposed Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
192.8	Alternatives	Runway 14/32	The entire analysis assumes that Runway 14/32 will be used only in overwater approaches and departures, but Appendix I indicates that US statute makes that decision solely the province of the FAA. Such decision must comply with NEPA. But there is no guarantee that even a full EIS would be required to use the runway in both directions... there is no basis for confidence that the runway will be unidirectional. The DEIS/R contains no analysis of the noise and safety impacts on Jeffries Point, East Boston, Charlestown and Beacon Hill that would be caused by two-way operation of Runway 14/32. Failure to disclose the potential impact, and the lack of any disclosure of credible guarantees on this matter is a substantial flaw that requires that the Draft EIS/EIR be rejected as inadequate.	A bi-directional Runway 14/32 was not considered for a variety of operational and safety reasons. The unidirectional Runway 14/32 concept analyzed in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR evolved from earlier feasibility studies including the FAA's *Boston Logan Capacity Enhancement Plan* (October1992), which determined that a bi-directional runway was not a feasible option. State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of Runway 14/32 involves physical limitations that reinforce unidirectional use. The Hyatt Hotel and Conference Center, which is located 1,300 feet from Runway 14 and is 174 feet high, invades FAA approach surface glide slope requirements, thereby precluding arrivals from the west to Runway 14. Additionally, the lack of available taxiways to allow aircraft to reach Runway 32 prevents aircraft departures from Runway 32. Massport will reinforce its commitment to unidirectional use by including the intended unidirectional limitation as a mitigation measure. This designation will be reinforced through Section 61 findings that will be adopted by the Massport Board as required under MEPA. It is anticipated that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
192.9	Noise	Stage 3	The DEIS/R uses 1999 simulated information as the basis of comparison for predicted year 2010 impacts in a variety of scenarios. The federal law requires that phaseout of all non-Stage III aircraft by the year 2000, so certainly Logan, with its stricter noise rule, should be all Stage III aircraft by the year 2000. For this reason, the 1999 simulation should be run with an all Stage 3 fleet, in order to understand the true impact of the various alternatives, and should be used in particular to identify Section 4(f) impacts, for all park and historical resources currently affected by Logan or potentially affected. Because of the failure to identify the 1999 all Stage III exposure, the basic analysis of Section 4(f) impacts and noise comparison among alternatives is seriously in error...	Comparisons of the Action Alternatives to the No Action Alternatives for individual fleet scenarios are the appropriate basis for evaluation and are not distorted. Fleet composition within each individual forecast scenario remains consistent. The phase-out of Stage 2 aircraft will reduce the noise impacts from Logan Airport, producing benefits to surrounding communities. These impacts are discussed in the *Logan Airport 1999 ESPR* (previously GEIR). The 29 M Low Fleet scenario includes 22 daily operations in Stage 2 aircraft (depending on the alternative examined), which represent about 2.5 percent of the total daily jet operations in that fleet. (Refer to Table 6.2-1 of the Supplemental DEIS/FEIR). In the shift to a post-1999, 100 percent Stage 3 fleet, some of these aircraft would likely have received hushkits resulting in very little improvement in the noise of individual overflights (and hence, little improvement in DNL), and some were likely converted to Stage 3 airplanes. However, on balance, the total number of Stage 2 operations in 1999 is small, and a revised 29 M Low Fleet scenario would leave a significant number of hushkitted airplanes to dominate the exposure. For these reasons, it is estimated that the presence of the Stage 2 airplanes in the 29 M Low Fleet scenario overstates noise exposure by only a few tenths of a dB, which does not represent a material difference.

Code	Topic 1	Topic 2	Comment	Response
192.10	Regional Transportation	Regional Airports	Massport owns Hanscom Field, an existing airport adjacent to Route 128, but no analysis is done of the potential share of commercial activity that Hanscom might absorb, and the net environmental impact on the Hanscom environment if military and general aviation activity were displaced. With no analysis of this alternative, the Draft EIS/EIR is substantially flawed and should be viewed as an inadequate basis for comment.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
192.11	Alternatives	Peak Period Pricing	The overutilization of Logan airspace by regional carriers who use 40% of the airspace to accommodate 10% of the passengers is the central problem driving delay at Logan, but the only option explored to deal with this is a very weak form of peak pricing, with a very high "trigger" of 110 movements per hour. No sensitivity analysis is presented, to explore the impact of different "triggers" set at 105,100 or 95 movements per hour. Also, the analysis methodology...does not explore the possibility the flights will be consolidated into a smaller number of larger aircraft. For this reason the analysis both understates the delay reduction potential of this method and overstates its economic impact.	Logan Airport's normal operating capacity is approximately 120 operations per hour, and is available nearly 80 percent of a typical year. The use of a 110 operations per hour threshold in the illustrative PPP program, which is ten operations below Logan Airport's normal runway capacity, represents a conservative value and avoids understatement of the potential delay benefits of the policy. The possibility that PPP would promote flight consolidation in regional carrier markets is reflected in the analysis presented in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR. This analysis forecasts a reduction in flight frequency within many regional markets with the program in effect.
192.12	Alternatives	Peak Period Pricing	The likelihood that even a weak form of Peak Pricing would tend to preclude the high delay "high" scenario is not even mentioned, even though the delay avoidance benefits of the Low vs. High scenario are greater than the differences among the alternatives considered. Since Peak Pricing will tend to inhibit the profitability of redundant regional services, it seems likely that the Peak Pricing would preclude the High Scenario from occurring, and that it should be tried before any of the construction scenarios...	Additional analysis of PPP is set out in Section 4.5 of the Supplemental DEIS/FEIR. This analysis includes the High Fleet scenario. Demand management measures at other United States and international airports are discussed in Section 3.5.

Code	Topic 1	Topic 2	Comment	Response
192.13	Alternatives	Non-Construction Alternatives	Other alternatives to control overscheduling such as "slotting" Logan at a reasonable number of movements per hour, using market measures to distribute the "slots" are not evaluated whatsoever.	Neither federal nor state scoping directives required an analysis of slot controls. Imposition of slot controls constitutes a federal policy that has been preempted to the FAA under federal law and is not within Massport's jurisdiction. PPP represents a market approach that should encourage the highest value services to use Logan Airport during periods of scarce capacity without the market disruption and other inefficiencies related to slot control. Congress determined that the slot program has a number of significant problems. The U.S. DOT has analyzed options for reducing slot controls at airports. As a result, the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR-21), which was enacted in March 2000, eliminates all slots at three of the nation's slot-controlled airports. Slots at the Chicago O'Hare Airport will be eliminated by July 1, 2002 and slots at New York LaGuardia Airport and New York JFK Airport will be eliminated by January 1, 2007.
192.14	Alternatives	Non-Construction Alternatives	Use of limited priority based on size of aircraft to reduce the impact of airfield delay is not considered.	The air traffic control system of the United States, which the FAA operates, is based on a first-come, first-serve policy. Any change in this policy would require a major federal decision that would involve a major overhaul of the entire air traffic control system, including procedures, manuals, software, controller/pilot training, etc. The FAA is continually evaluating alternatives to increase efficiency of the national airspace system. However, future FAA initiatives will not eliminate the need for the proposed airfield improvements at Logan Airport. The FAA's national initiative will not prevent the decline in capacity under northwest wind conditions that occur at Logan Airport.
192.15	Alternatives	Non-Construction Alternatives	Simple "jawboning" of regional air carriers is a technique that might have substantial benefit, especially if accompanied by phase-in of Peak Pricing or lease restrictions to encourage movements toward an all-jet Logan.	As a mitigation measure, Massport will establish a Peak Period monitoring programs as outlined in Section 4.5 of the Supplemental DEIS/FEIR.
192.16	Alternatives	Peak Period Pricing	The effectiveness of the P.A.C.E. program in 1988 is not described or evaluated.	The impacts of the Program for Airfield Capacity Efficiency (PACE) are described and evaluated in Section 3.5 of the Supplemental DEIS/FEIR.
192.17	Alternatives	Taxiway Improvements	There are no alternatives considered to the Centerfield Taxiway proposal. It would appear that the threshold of Runway 4L/22R could be displaced substantially to the south, in order to increase the height of aircraft landing over the Bayswater Street neighborhood, reducing noise and increasing safety margin.	The threshold for Runway 22R is already displaced 845 feet to the south, which increases the height of landing aircraft by only 42 feet. Further displacement would not be a substitute for the benefits of the Centerfield Taxiway. Moreover, Runway 22R is used almost exclusively for jet and non-jet departures so further displacement would have a negligible effect on the impacts of landing aircraft traffic. The northern end of the Centerfield Taxiway will provide an alternate routing for those heavy jets that require the length of Runway 22L for takeoff, allowing them to avoid the queue on Taxiway November. The southern end of the Centerfield Taxiway allows arrivals on Runway 22L and Runway 27 to be routed more efficiently for crossing Runway 22R with reduced delays and minimized ground idling.

Code	Topic 1	Topic 2	Comment	Response
192.18	Alternatives	Taxiway Improvements	It should be possible to consider replacing Taxiway November with a buffer ?? [sic] to protect the beach. Since the entire premise of the Massport airfield proposal is that the 4/22 runways will be utilized less, it is not clear why the centerfield taxiway is needed at all, or alternatively why a sanitized northerly ENV of runway 4L-22R cannot serve as the taxiway for the northerly portion in lieu of the "November" taxiway which adversely affects Constitution Beach.	Converting Runway 4L/22R north of Runway 15R/33L into a taxiway would cause a major reduction in the takeoff distance available on Runway 22R as well as in the landing distance on Runway 4L. When operating to the south, most departures would need to use Runway 22L instead of Runway 22R, which would mean significantly increased ground congestion, delays and associated environmental impacts. To the north, fewer arrivals would be capable of using Runway 4L, which would increase delays on Logan Airport's highest volume configuration.
192.19	Environmental Justice		The core [process] of the Executive Order, and the DOT implementing order of April 1997 ... was not followed.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. TEST Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation.
192.20	Noise	Soundproofing	The interpretation that soundproofing can mitigate, so that the impact can be denied is inappropriate.	The Final U.S. DOT Order on Environmental Justice directs FAA to determine whether its programs, policies and activities will have a disproportionately high and adverse impact on minority or low-income communities, taking account of mitigation, enhancement measures, and all offsetting benefit's to the affected populations, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas.
192.21	Noise	Soundproofing	...there is no disclosure in the draft EIS of how soundproofing can be achieved in low-income housing units where the structure may have other building code problems...	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport-sponsored sound insulation program. However, to address impacts in particular projects, such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of the mitigation program to the extent such improvement are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes. For the eligible residences, the FAA will fund building code improvements, to the extent necessary, to implement effective sound insulation treatment.

Code	Topic 1	Topic 2	Comment	Response
192.22	Noise	Soundproofing	There is no discussion of the kind of [soundproofing] program that would be required to make it work for non-owner occupied low-income housing.	Refer to response to Comment 192.21.
192.23	Environmental Justice		There is more discussion of the economic impact of Peak Pricing on Cape Air, and prediction of difficulty of access to Nantucket, Provincetown and Martha's Vineyard than there is in the entire Environmental Justice section!	The Supplemental DEIS/FEIR significantly expands upon the discussion of Environmental Justice presented in the Airside Project Draft EIS/EIR. Refer to response to Comment 192.19 and Section 6.8 of the Supplemental DEIS/FEIR.
192.24	Environmental Justice		The analysis of differential impact should be *comparative.* Alternatives such as Hanscom Field or Peak Pricing are likely to have NO adverse impact on low-income or minority populations. Moreover, low income people, who are less likely to fly, are less likely to benefit from any reduction in delay. But there is no comparison of alternatives based on environmental justice concerns.	The Environmental Justice analysis in Section 6.8 of the Supplemental DEIS/FEIR complies with the applicable requirements of Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on Environmental Justice. The Preferred Alternative will not have a disproportionate high and adverse impact on minority or low-income populations.
192.25	Environmental Justice		Whatever an appropriate decision might be *after* Environmental Justice consideration...The Executive Order and DOT implementation order are clear that Environmental Justice principles are to be considered at the earliest possible point in the process and occur before decisions are made. that has clearly not occurred in this draft EIS ...	Refer to response to Comment 192.24.
192.26	Environmental Justice		The television and radio (and newspaper) advertising program by Massport constitutes a major flaw in the environmental process and [is] a violation of environmental justice ...	Massport did not sponsor television, radio, or newspaper advertisements for the Airside Project. Massport disagrees with the other assertions in this comment.
192.27	Environmental Review Process	MEPA	The DEIS/R is so deficient and misleading that it should be rejected and "rescoped" ...The scope of the document was established in 1995, over 3 years ago.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the Draft EIR, dated May 7, 1999. The issues identified in the MEPA Scope for both the Draft EIR and Final EIR continue to be relevant. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of fifteen visual and written presentations from the Project's technical consulting team and other independent industry experts.
192.28	Environmental Review Process	NEPA	The DOT Implementing Order for the Executive Order on Environmental Justice was issued April 15, 1997...Environmental Justice principles are to be applied at the earliest possible time. These procedures were not followed...	Refer to response to Comment 192.24.

Code	Topic 1	Topic 2	Comment	Response
192.29	Purpose and Need	Delay	Since by Massport information the northwest wind problem causes approximately 20% of airfield delay, and the remainder of airfield delay will grow to exceed current airfield delay within 5 years, this is much too narrow a problem definition to be serious, and appears to have been selected to predetermine a conclusion to build Runway 14/32.	While Massport cannot reduce delays caused by snowstorms, fog, and other severe weather conditions, it can affect delays that occur in VFR conditions. These delays are caused by a fundamental inadequacy in Logan Airport's airfield layout, *i.e.*, the lack of a third available runway in the northwest-southeast operating direction. When strong northwest winds force the airport to a northwest-southeast orientation, air traffic controllers lack a third available runway. If no actions are taken, the VFR component of delay will increase the fastest. The proposed unidirectional Runway 14/32 would produce immediate delay reduction benefits that would increase into the future as forecast activity levels grow. Under a near-term, 29 M Low Fleet scenario, the Preferred Alternative reduces annual delay by 28,000 hours. Under a longer-term 37.5 M High Fleet scenario, the Preferred Alternative saves 94,000 annual hours of delay. Delays caused by northwest winds represent a significant problem at Logan Airport, and one that can be addressed through the recommended construction of unidirectional Runway 14/32. Other elements of the Airside Project address other issues related to delay, airfield efficiency, and safety at Logan Airport. The Preferred Alternative was selected after careful analysis of operating and environmental considerations
192.30	Purpose and Need	Delay	Even all airfield delay is too narrow a problem definition, as it concentrates excessively on the airfield, to the exclusion of delays caused by deficiencies in the terminal configuration.	Refer to response to Comment 192.2.
192.31	Purpose and Need	Delay	The definition of airfield delay does not include analysis of delays caused by small aircraft in the fleet mix. The FAA safety procedures require increased separation when significantly different aircraft follow each other, affecting capacity and causing delay. There is no consideration of this issue, nor is any time dimension placed on the differential time required in transit by the current practice of using non-jets in regional markets. The DEIS/R does not include analysis of the constraint imposed by differential size.	The mix of large and small aircraft at Logan Airport and the resulting impacts on aircraft separation requirements are reflected in simulation modeling for this project.
192.32	Regional Transportation	Regional Airports	There is no analysis of the potential restructuring of regional air travel, as small jet services make direct flights from Green, Manchester, Portland and other regional airports more attractive than the indirect service of regional carriers to Logan to transfer to other flights.	Developments at the regional airports and their impacts on Logan Airport are described in Sections 2.3 to Section 2.6 of the Supplemental DEIS/FEIR. Massport considers Logan Airport to be part of a regional system of airports that includes T.F. Green/Providence, Manchester, and Worcester Regional airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of these regional airports. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. The benefits of improved direct services at the regional airports have, in certain instances, reduced dependence on Logan Airport for connecting services. For example, Manchester Airport received hourly service to Logan Airport in the late 1980s, but receives no Logan Airport flights today. This reflects the availability of improved access to other hubs and major origin and destination markets from Manchester Airport.

Code	Topic 1	Topic 2	Comment	Response
192.33	Purpose and Need	Delay	Even all aircraft delay is too narrow a scope, focusing excessively on the interest of efficient utilization of aircraft. Passenger delay includes delay in processing ticketing and baggage for both enplaning and deplaning passengers. ... these delays clearly involve more passenger hours than the airfield-related weather delays, but they are borne by the passengers, not the airlines, and are not analyzed in this DEIS/R.	Refer to response to Comment 192.2.
192.34	Purpose and Need	Delay	There is no analysis of passenger delay in accessing Logan on the metropolitan area road and transit system. This system is congested, parking at Logan is limited by the Clean Air Act parking "freeze," and improvements in public transport access are lagging. This factor affects passenger and cargo delay and reliability, and appears to be affecting consumer choices to use Manchester or Green instead of Logan.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR assess potential improvements to Logan Airport's airfield that will reduce delay and enhance airfield efficiency and safety, as required by federal and state scoping directives.
192.35	Environmental Review Process	NEPA	Regional EPA proposed in its scoping comments of 1995 that a comprehensive analysis of the airport, including the (metropolitan) ground access and terminal capacity and its interrelationship with any airside proposals should be included. Unfortunately, the DEIS/R ignores the need for a comprehensive approach, and refers the reader to the Generic EIR, a state document which, among other problems, deprives citizens of protection of federal laws such as the NEPA requirement to analyze socio-economic as well as environmental concerns, Title VI (Civil Rights), Section 4(f), and the Executive Order on Environmental Justice.	The Draft EIS/EIR for the Airside Project responds to the FAA Scope as part of the Airside Improvements Planning Project Draft EIS/EIR process and responds to the MEPA Certificate, both which were developed through a public comment process. The ongoing state ESPR process provides information to the federal and state agencies and the general public on the environmental effects of existing and future operations at Logan Airport, on the cumulative effect of airport operations, and on the planning context for individual projects at Logan Airport. The GEIR/ESPR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR as a background document. With the GEIR/ESPR providing background information, the FAA called for a project-specific review, including a cumulative impact assessment, under its NEPA regulations, for the Airside Project. This two-level process has identified the cumulative environmental impacts of operations and projects at Logan Airport and has provided a proper foundation upon which the FAA has fulfilled its NEPA responsibilities.
192.36	Ground Transportation	Access to Logan	At the time of the scope of the DEIS/R was developed, Massport was proposing a "People Mover" to substantially improve transit access to the Blue Line, and the CA/T project was committed to a major upgrade in the Blue Line Airport Station, including cross-platform transfers in both directions. Now Massport and MassHighway have withdrawn these commitments, giving rise of the question, "How on Earth can Logan handle 50% to 100% growth in passengers with a parking freeze and no significant transit improvement in sight?"	The MBTA is developing a new Logan Airport Station to be located about 400 feet north of the existing Logan Airport Station. Massport is consulting with the MBTA on the project's design and operational elements. The new Logan Airport Station will include modern passenger amenities such as wide escalators, oversized elevators, and real-time flight information displays in the station lobby. It will also provide a convenient at-grade connection to the neighborhood, AITC Blue Route and Logan Airport, and may become a stop on the MBTA's proposed Circumferential Transit (Urban Ring) service. Massport has implemented an aggressive airport access program designed to increase the use of public transport modes and decrease the reliance on private automobiles to access Logan Airport. This program is described in the *ESPR*. The *ESPR* analysis indicates that Logan Airport can accommodate the projected growth.

Code	Topic 1	Topic 2	Comment	Response
192.37	Environmental Review Process	MEPA	In 1995, the Port Authority was talking about redeveloping Terminal A through a "privatization" mechanism. Today they have apparently concluded that will not succeed, but there is no clear timetable for the redevelopment of Terminal A, the most prominent terminal at Logan, and the most problematic. While that terminal is being redeveloped, the capacity to handle passengers will go *down* unless a successful mitigation strategy can be developed. Terminal A was to have been redeveloped with a shape designed to buffer noise impacts on the nearby Jeffries Point neighborhood. In addition, and with no increase in number of gates, rumors indicate that Massport now intends to abandon the noise buffer shape, and add gates. This would constitute "segmentation." A revised scope should include Terminal A redeveloped including any options.	An Environmental Assessment/DEIR for the redevelopment of Terminal A by Delta Air Lines was filed with the MEPA Office on May 31, 2000. The terminal retains the noise buffer shape that will reduce aircraft noise impacts on the Jeffries Point neighborhood. The proposed Terminal A satellite concourse, located parallel to Harborside Drive, will act as a sound barrier for the Jeffries Point community. The project received state environmental approval in late 2000.
192.38	Analysis Assumptions/ Methodologies	Delay Model	Most of the projections in the DEIS are based on these [1993] projections. The DEIS concedes that airfield delay at Logan actually went down since 1993, but there is no effort to analyze what happened, much less to correct the computer programs to incorporate this forecasting.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
192.39	Alternatives	Runway 14/32	... experience shows that during delay conditions the FAA controllers ignore PRAS goals and utilize maximum capacity configurations, so the tripling of exposure to overflight predicted with availability of Runway 14/32 actually *understates* the likely reality. More realistic utilization estimates should be prepared, at least to provide a range of estimate.	The simulation modeling performed for the Airside Project study analysis understates PRAS only when more than one available runway configuration has sufficient capacity to accommodate demand. There is no basis for the claim that the Airside Project understates the changes in overflights resulting from Runway 14/32.
192.40	Analysis Assumptions/ Methodologies	Noise	Noise impact from aircraft is projected in the DEIS by using computer models, but citizens have complained for years that the noise levels measured by Massport microphones monitored in the field show that actual noise consistently exceeds the predicted levels.... In addition, these same models are used to predict noise consequences of the airfield proposals, so the predictions in the DEIS/R understate actual impact. The computer models should be adjusted to better simulate actual noise impacts.	Refer to response to Comment 192.5.
192.41	Analysis Assumptions/ Methodologies	Noise	... MEPA requested the preparation of 60 dB contours, ... 60 dB contours should be prepared and used in the analysis.	The DNL 60 dB contours and related data were included in Appendix L of the Airside Project Draft EIS/EIR and are also included in the Supplemental DEIS/FEIR.
192.42	Ground Transportation	Access to Logan	Credibility of environmental commitments has been undermined by MassHighway reneging on the Airport Station Blue Line commitments. In addition, the MassHighway revisions constitute a segmentation flaw in the airfield project. The MassHighway proposal should be suspended, and it and suitable alternatives incorporated into the revised scope.	The MBTA's Airport Blue Line Project is under control of a government entity over which Massport has no jurisdiction. After the submission of the Airside Project ENF, MassHighway issued a Notice Of Project Change for the Airport Blue Line Station, which documents the project's status and associated mitigation commitments.

Code	Topic 1	Topic 2	Comment	Response
192.43	Environmental Review Process	NEPA	... based on these multiple flaws, the DEIS/R scope is so out of date as to be meaningless. It should be withdrawn and a new scope developed, consistent with Environmental Justice principles.	The Draft EIS/EIR for the Airside Project responded to the FAA Scope and the MEPA Certificate, which were developed through a public comment process. Over 400 comment letters were received on the Airside Project Draft EIS/EIR document. The Supplemental DEIS/FEIR responds to additional federal and state scoping directives, which were issued in response to the public comment letters on the Airside Project Draft EIS/EIR. Refer to response to Comment 192.27.
192.44	Purpose and Need	Airfield Capacity	Because of a variety of wind and weather conditions, reliability of Logan is much higher at frequency of less than 100 movements per hour, whereas it becomes very unreliable as utilization approaches the maximum capacity of close to 120 movements per hour. Yet the DEIS/R does not provide basic information to identify the reliability of Logan at 75, 85, 95, 105, 115 movements per hour so that the trade off between frequency and reliability can be understood.	The Airside Project analysis of PPP examined an operations threshold of 110 operations per hour, which is already below Logan Airport's normal operating capacity of 120 operations per hour. There is no legitimate operational justification for imposing a peak period surcharge at an operation level significantly lower than Logan Airport's normal operating capacity which is achieved 80 percent of the year without any delays. Even at 75 operations per hour, Logan Airport would be subject to delays from northwest wind conditions. The Airside Project analysis in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR indicates that, with the Preferred Alternative, Logan Airport can accommodate existing and foreseeable future levels of demand without imposing a drastic administrative restriction to artificially revise Logan Airport's existing capacity.
192.45	Purpose and Need	Airfield Capacity	The further fundamental issue at Logan is the fact that approximately 40 percent of the airside capacity is used to accommodate small regional non-jets which carry 10 percent of the passengers...If substantial consolidation of regional flights could be achieved, Logan would operate at or below 100 movements per hour and be highly reliable.	The presence of small aircraft in the fleet mix is a reflection of Logan Airport's role as a regional hub for both local and connecting passengers from small- and medium-sized communities in New England and the northeast United States. Logan Airport's normal operating capacity is 120 operations per hour and is available approximately 80 percent of the time. When these high capacity configurations are available, current flight demand can be accommodated with minimal delay. Runway 14/32 is designed to prevent the drop of capacity that occurs during northwest winds and will increase the reliability and efficiency of the airfield.
192.46	Alternatives	Non-Construction Alternatives	[Suggests better use of Logan Airport by using a variety of operational restrictions include "jaw boning" on scheduling, peak period pricing, prioritization of larger aircraft, becoming an "all jet" airfield, or "slotted" airfield.]	Refer to responses to Comments 192.13 through 192.15.
192.47	Alternatives	Peak Period Pricing	... the analytical approach to analyzing the peak pricing seems totally flawed. The DEIS/R ... ignores the fact that the existence of even a weak peak pricing system would inhibit the "high fleet" scenario from developing at all, ... the differences in delay between high fleet and low fleet scenarios are greater than the differences in delay between the "with" and "without" Runway 14/32 within a given scenario. This leads to a conclusion that the introduction of even a weak form of peak pricing should occur immediately as suggested by EPA in 1995, so its effects can be evaluated and fine tuned.	PPP and Runway 14/32 are designed to address different causes of delay. PPP would target delays that result from airline overscheduling, while Runway 14/32 is designed to prevent delays that occur during northwest winds. Massport believes that the proposed Peak Period monitoring system would provide the necessary market signals to discourage airlines from scheduling above capacity. Refer also response to Comment 192.12.
192.48	Alternatives	Peak Period Pricing	The DEIS fails to report on the performance of the PACE program ...	Refer to response to Comments 192.16.

Code	Topic 1	Topic 2	Comment	Response
192.49	Analysis Assumptions/ Methodologies	Noise Model	The noise analysis is inappropriate, systematically understating the likely average noise impacts of the introduction of Runway 14/32. While the DEIS predicts a tripling of overflights ... the model is constrained by PRAS goals. But experience has shown the FAA control tower will ignore PRAS goals whenever there is congestion, so even greater increases are likely.	The simulation modeling performed for the Airside Project study analysis considers PRAS only when more than one available runway configuration has sufficient capacity to accommodate demand. (Refer to Section 4.3 of the Supplemental DEIS/FEIR). There is no basis for the claim that the Airside Project understates the changes in overflights resulting from Runway 14/32. Even so, Massport and the FAA are working together to improve conformance with PRAS recommendations and, as a mitigation measure, Massport is proposing a PRAS monitoring system to provide greater analysis and insight into the conditions when PRAS recommendations cannot be met. Massport is also committing to publishing system reports in the *Logan Airport 1999 ESPR* (previously GEIR) and subsequent annual reports.
192.50	Environmental Review Process	MEPA	... the addition of Runway 14/32 clearly increases the noise affected population, and thus violates the 1987 environmental cap, and should be rejected on that basis alone.	For all the alternatives, the Airside Project analysis determined that the noise-affected populations, in both 1999 and in future years, are well below the cumulative noise exposed populations that existed in 1987.
192.51	Analysis Assumptions/ Methodologies	Noise Model	It is the increase in exposure of households in the 60 dB contour who represent the most significant worsening of noise conditions, without soundproofing, but these numbers are not calculated, and the 60 dB contours are hidden in an Appendix. The benefit of compliance with PRAS is exaggerated in the DEIS/R.	The FAA as well as the Federal Interagency Committee on Aviation Noise (FICAN, which includes among its members the U.S. EPA and HUD) still recognize a DNL of 65 dB as indicative of significant noise impact and DNL levels above 75 dB as inappropriate for residential use because they are so high. The Preferred Alternative helps reduce exposure at this highest level as well as at levels above 70 dB. Nevertheless, all member agencies acknowledge that community annoyance and complaints also occur at DNL levels below 65 dB. As a result, the 60 dB DNL contours are now shown throughout the Supplemental DEIS/FEIR, and the numbers of people within the DNL 60 dB contour *are* calculated and reported in tables such as 6.2-3 through 6.2-7, 6.2-18 through 6.12-21.
192.52	Analysis Assumptions/ Methodologies	Noise Model	In addition, the selection of 1999 and 2010 distorts the [noise] comparisons, since the phasing out of all Stage III aircraft is due in 2000, and make it more difficult to understand the effect of various proposals. Including a 2001 analysis would separate this effect.	Comparing the Action Alternatives to the No-Action Alternative within the context of each projected fleet is the only appropriate way to evaluate the relative impacts of each proposed action. This does not distort the conclusion as to the relative impact of each scenario; on the contrary, only in this way is it possible to judge the effects of each alternative on delay and flexibility of runway use and in turn examine the consequence of those factors on noise. That said, the 29M Low Fleet scenario, while initially developed as a forecast in the early stages of this *Airside Improvement Planning Project*, has turned out to be a reasonable approximation of the fleet existing in the year 2000. Though the 29M Low forecast scenario includes 22 daily operations by Stage 2 airplanes and it is now true that Stage 2 operations by aircraft greater than 75,000 pounds have been phased out of air carrier fleets in response to federal regulations, a number of those Stage 2 airplanes were simply hushkitted as opposed to replaced; their noise levels are only slightly below the noise of their Stage 2 predecessors.

Code	Topic 1	Topic 2	Comment	Response
192.53	Alternatives	Reduced Approach Minima	Analysis of the Reduction in Landing Minimums is Misleading and Inadequate. The landing minimums on Runways 15 and 22 were deliberately held high pursuant to agreements with the City of Boston. The community's objective in negotiating these higher than normal decision heights was to discourage use of landing over populated areas during low visibility conditions, and to encourage instead the use of overwater approaches during low visibility conditions, by installing Category III instrument landing systems, with the lowest decision heights on the 4R and 33L overwater approaches. ... Category III ILS has yet to be installed on Runway 33L. The DEIS/R predictions of improvement of reliability during low visibility conditions is not disaggregated to identify the benefits attributable from improved instrumentation on runway approach 33L which the community supports, as distinguished from the decision height reductions on runway approach 15R and 22L, which the community opposes. ... [T]he community has always understood that low visibility conditions generally occur under low wind conditions, but the DEIS/R implies that wind direction is a factor in this proposal. No identification of the frequency of high wind/low visibility conditions, or data, is presented. Finally, the community concern with low visibility landings over populated area is with safety, and the anxiety caused by such operations in the residential population, but the DEIS/R treats it as a simple noise problem.	The reduced landing minimums do not change the approach path nor reduce the clearance between aircraft and the surface. They will increase airfield safety by allowing operations more directly into the prevailing wind and will help improve PRAS goal achievement. Low visibility is often associated with fog, especially for coastal locations such as Logan Airport, but precipitation or low clouds also restrict visibility.
192.54	Alternatives	Taxiway Improvements	The analysis of the taxiway proposals is inadequate...since the DEIS/R states that the intention of the package is to *reduce* utilization of the 4/22 runways, it is difficult to understand what delays are proposed to be alleviated.	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays, thereby reducing associated noise and emissions. Chapter 3 of the Supplemental Draft EIS/Final EIR describes several operating situations that would benefit from these improvements. Unidirectional Runway 14/32 would allow more balanced runway use, reducing the use of the Runways 4/22 from 65 to 37 percent (37.5M Low fleet scenario).
192.55	Analysis Assumptions/ Methodologies	Passenger Forecasting	... there is no analysis to show what number of passengers will be able and willing to access Logan over the next decade so the air service needs can be verified, and the timing of improved access to Green Providence via rail, and high-speed rail to New York can be evaluated in the light of more severe growth and terminal access problems at Logan.	The range of air traffic and operations forecasts considered in the airside analysis allows significant variation in current and future passenger activity levels at Logan Airport. Potential diversion of Logan Airport passengers because of high-speed rail and other regional rail projects are addressed in Section 2.7 of the *Supplemental DEIS/FEIR*. The Preferred Alternative produces substantial benefits at current activity levels and these benefits increase as activity levels grow in the future. Massport has implemented an aggressive airport access program designed to increase the use of public transport modes and decrease the reliance on private automobiles to access Logan Airport. This program is described in the *ESPR*. The *ESPR* analysis indicates that Logan Airport can accommodate the projected growth.
192.56	Environmental Review Process	MEPA	[Asks that the appendices of the history of Logan be more comprehensive in detailing airport-related events that have impacted the community.]	The Draft GEIR published in December 1991 documented the development history of Logan Airport from its inception as a military facility to its status as an international airport serving the New England region.

Code	Topic 1	Topic 2	Comment	Response
192.57	Environmental Review Process	MEPA	Given the reliance on environmental commitments in the proposed Runway 14-32, a list of "broken promises" that undercut the credibility of such assurances is worthwhile. A) Airport Blue Line station (CA/T Commitment, but Massport did not defend the honoring of the commitments to cross-platform transfers and at- or below-grade highways, when Mass Highway removed the Transit improvements and substituted very high (36' and 53' high) highway ramps.) B) Airport buffer edge (not implemented) C) Free shuttle to South Station, added Logan Express service, PeopleMover to Blue Line to increase capacity by a factor of six (now broken). D) Flight tracks and PRAS E) Landing decision heights in bad weather F) Taxiway use regulation to restrain noise exposure at the northern end of the 4-22 runways. G) The blast fence at the northern end of the Runway 22R, which Massport intermittently proposes to remove.	FAA and Massport disagree with this comment.
192.58	Open Space/ Parkland	Noise Levels	... all Section 4(f) resources affected by current operations or proposed actions should be identified. Their noise exposure today and in 2001, within all Stage III fleet should be identified, to establish a new "Base Condition" based on existing regulation, and the impact of various proposals upon 4(f) resources identified. In addition, analysis to identify "all flexible planning to mitigate adverse impact should be carried out and presented.	The proposed improvements at Logan Airport will neither incorporate land from the Section 4(f) resource nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site. Therefore, the Preferred Alternative does not constitute a use of Section 4(f) resources. In addition, the FAA has determined that there are no feasible or prudent alternatives to the Preferred Alternative that would achieve the delay reduction, safety, transportation, noise distribution, and other objectives of the Preferred Alternative. Therefore, even if the noise levels associated with the Preferred Alternative were determined to interfere with the normal activity associated with the identified Section 4(f) resources (which they do not), the FAA concludes that the sound insulation mitigation proposed for the affected Section 4(f) structures includes all possible planning to minimize harm from that increase in noise.
192.59	Cumulative Impacts		A revised DEIS/R scope should carry out an analysis of impacts on coastal zone and smart growth land resources in the South Boston Seaport area, Chelsea, Everett and Somerville.	Refer to response to Comment 192.7.

From: Fred Salvucci

Date: 5/4/99

Re: Summary of points discussed at April 29 meeting.

First I would like to thank you and John Silva for the time you took to meet with Anastasia Lyman and myself last Thursday. I thought it might be useful to summarize the major flaws in the Massport DEIS/R, which we believe make it inadequate to serve as a Draft EIS and require it to be revised substantially into a new Draft for public comment. In addition, we are urging that the revised Draft should drop further consideration of Runway 14-32, and summarize our arguments why this would be the most productive way to proceed.

Primary Deficiencies in the DEIS/R.

1) The likely and potential role of regional alternatives to Logan is not properly assessed in the DEIS. 193.1

   a) The DEIS/R identifies passenger growth at Logan from an estimate of 29 million annual passengers for 1999 to a range of 37 to 45 million passengers in 2010.

b) The DEIS/R identifies 7.5 million passengers likely to be attracted to other regional options, including high speed rail, growth in Manchester and Green, and telecommuting, but it does not adjust the basic 37 to 45 million projection downward to reflect this growth. Such a revision would seem to lower the range to 30 to 37 million for 2010, as indicated in table 2.4-9, on page 2-37. However, all the delay estimates in figure ES-3 on page ES 19 and table 4.2-7 on page 4-11 *do not make any adjustment for regional alternatives*. 193.2

c) Further development of Worcester, as recently announced by Governor Cellucci and Massport, if it would attract 50% of its natural market, as allowed for Manchester, or 75% as allowed for Providence, should represent an additional 1 to 2 million passengers. The opening of rail service to Green should expand its "natural" market, attracting a larger share of passengers. Passenger rail service to Manchester could have similar effects; a substantial part of the outside of Rte. 128 metropolitan market, estimated as 28% of Logan's current market, would likely be attracted away from Logan by the combination of high speed rail, Green, Manchester and Worcester. 193.3

d) In the context of the "hassle factor" of getting to Logan, with several years of Big Dig construction, the necessary redevelopment of Terminal A, the high cost of parking at Logan, the limit on any growth in parking supply, it is reasonable to expect that the Massport DEIS substantially overestimates 193.4

the likely growth in Logan passengers, and fails to consider aggressive further regional options as an alternative.

193.4 (cont.)

The fact is that no one anticipated in 1995 the level of success which the regional efforts of FAA in partnership with the localities who want aviation growth might enjoy. This success is to the credit of FAA, but the DEIS does not adequately reflect the predictable impact of existing initiatives nor consider the potential of new initiatives at Worcester or Manchester.

2) The DEIS translates the number of passengers expected at Logan into a range of estimates using a "high" and "low" projection of regional movements, and analyzes the effect of the proposed Runway 14-32, the proposed added taxiway, and peak pricing. But the largest differences in projected delay are between the high and low scenarios, and the analysis does not consider the impact of the alternatives considered on the overall fleet mix, and the high or low scenarios. But based on the analysis in the DEIS the "overscheduling" of regional services will not occur with peak pricing, because the market incentive to oversupply with small aircraft will be diminished. Moreover, one might expect that construction of Runway 14-32 might lead to increased use of small aircraft, by improving schedule reliability of small aircraft in comparison to large, and perversely affect the total number of aircraft movements required to serve any given number of passengers. The failure to consider these effects result in underestimating the benefits of peak pricing, and overestimating the benefits of Runway 14-32, and is a substantial flaw.

193.5

3) There is very little information about actual delay at Logan, and how it has increased or decreased over the years. The CAC believes that delay had decreased at Logan by 18% from 1993 to 1998, based on review of FAA and DOT data, but there is no clear information in the DEIS. This is a substantial deficiency. Moreover, the 1988 PACE program is mentioned, but there is no description of what impact it had in less than a year, and no analysis of what impact it might have had if continued over a longer period. 193.6

4) There is no exploration of exemption or grandfather provisions to deal with any particular economic impacts in special markets such as the Cape, even though the regional office of the EPA specifically requested this analysis in 1995. 193.7

5) There is no clear analysis of the 10% of Logan passengers in regional non-jet services who consume 40% of Logan airspace capacity, and how this particular part of the market is likely to evolve given existing growth in regional air services, and how these trends might be expected to be affected by peak pricing and by the construction of Runway 14-32. 193.8

(A) If we estimate total annual passengers at 37 to 45 million by 2010, 10% of these would be 3.7 to 4.5 million passengers. The DEIS says that 2/3 of these are not destined for Boston, but are making connections through Logan to other destinations, which is to say 2.4 to 3 million through passengers.

(B) If the dramatic improvements in airline services to smaller regional airports continue, and allow 50% of these passengers to make direct flights, these represent 1.2 to 1.5 million passengers otherwise served by non-jet commuters who would use direct services instead. This would lower the 3.7 to 4.5 million to 2.4 to 3 million passengers in regional non-jet services, somewhat *below* current absolute numbers. Because these passengers would be expected to use non jets,. At current loadings of approximately 15 passengers per flight, a reduction of 1.2 to 1.5 million passengers would represent 80,000 to 100,000 flights, more than the difference between the 1999 low and 2010 37 million high scenarios! A conservative assumption might be that current regional non-jet frequency is maintained. If the 1999 estimate of 10% of 29 million represents 2.9 million passengers, in 197,000 aircraft movements of 15 passengers per aircraft, were to remain constant, the 37 million low scenario would be *further diminished* by 50,000 flights, and the 45 million high scenario would be diminished by 100,000 flights. Which is to say the potential reduction of regional non-jet flights at Logan due to strengthening of the regional capture rate of a hypothetical 50% of connections through, non-jet flights exceeds the aircraft movement relief identified in the DEIS for regional capture of air passengers who now drive to Logan, and the two numbers are additive!

(C) Congestion at Logan actually encourages airlines to improve direct service to regional airports in order to achieve improved equipment

utilization, and encourages passengers to prefer direct flights to avoid the uncertainty caused by connection through Logan, in addition to the comfort and convenience of direct small and mid sized jet services, closer to home.

(D) If we consider the likely effect of peak pricing on these regional non-jet flights, above and beyond the flight reductions predicted by the DEIS due to cancellation of flights, and shifting to the off peak, one would expect that peak pricing would encourage passengers to use direct flight rather than routing through Logan, by providing a price incentive. In addition, peak pricing should produce an incentive to shift from non-jet to larger "small jets" scheduled less frequently, both to accommodate customer preferences for the superior aircraft and to respond to peak pricing. Essentially the peak pricing is likely to provide monetary incentives to airlines to produce (and passengers to prefer) improved regional services, instead of the congestion of Logan which now provides incentive for regionalization. 193.9

(E) By contrast, if Runway 14-32 is provided, an opposite incentive is introduced by giving small regional feeder service preferential on-time performance, at lower landing fees, but increasing delay for all the aircraft during the 80% of non northwest wind related delay. Additionally, by increasing the number of small aircraft at Logan, one would expect added delay due to vortex avoidance requirements, but that is not stated. 193.10

(F) There is no analysis of other regulatory means to encourage regional flight consolidation such as a "slot" system. Regional EPA explicitly requested such analysis in 1995, but the DEIS "stonewalled" on the issue by asserting that slots are anti-competitive. As practiced in New York, Washington and Chicago, slots may be anti-competitive, but that does not preclude considering a slot system to analyze potential reduction and noise abatement benefits. Additionally, slots could be distributed based on service criteria such as aircraft size, or a price auction in order to avoid anti-competitive effect, but no analysis was done to consider this. 193.11

(G) There is also no consideration of a system to manage delay whenever it occurs by prioritizing takeoff of larger aircraft over smaller, (with upset limits so that no aircraft is forced to wait more than a certain movement behind their "first come first served" place in line. Based on theoretical simulation, there appears to be substantial potential to reduce delay rates to both airlines and passengers, but the possibility is not considered. Such a system would also be expected to have a long range effect of encouraging direct service from regional airports to avoid Logan, and encourage consolidation of regional non-jet flights into a small number of flights in larger "small jet" aircraft. 193.12

6) There is no consideration of the ground access constraints at Logan, although the regional EPA specifically requested such an analysis in 1995. Given the Clean Air Act parking freeze at Logan, Logan cannot accommodate more auto access, so any passenger growth must occur by improved transit. This has two ramifications; 193.13

(A) For the 28% of Logan passengers originating in the Boston metropolitan area outside of Route 128, the attractiveness of regional alternatives such as Green, Manchester, or Route 128 will be substantially strengthened.

(B) The importance of transit improvements to properly serve the growing needs of the area within Route 128 is enormous, and totally inconsistent with Mass Highway's proposed reneging on improved access to the airport MBTA station, and foot dragging on Urban Ring service, and Massport's apparent indifference to this matter.

(C) Truck and auto access to the north and northwest, in particular to Chelsea and Everett, Revere, Lynn and the North Shore, are particularly problematic, and have been ignored in the current Mass Highway plans for Contract 8A which appear to make them worse.

7) The Massport DEIS does not follow the Executive Order on Environmental Justice. 193.14

(A) The tripling of overflight in East Boston and Chelsea and the Andrew Sq. section of South Boston and Roxbury clearly represents an enormous shift of overflight from overwater and/or middle income areas to low income and minority population areas, which should have triggered a process of identification of target populations, adverse impacts, alternatives, communication with affected groups, and adoption of all feasible alternatives to avoid adverse impact.

(B) In addition, the disproportionate impacts of Mass Highway's proposals for Contract 8A, which would include very high viaducts adjacent to existing and proposed parks and residential areas, adjacent to low income and minority neighborhoods, and the expansion of Logan Airfield into the "Robie" property, towards the same neighborhoods which are also adversely affected by Runway 14-32 , compounds the Environmental Justice violation.

(C) Recent information indicates that Massport intends to abandon the design for the redevelopment of Terminal A previously agreed to with the community. That design provided a shape that would buffer noise from the Jeffries Point neighborhood and Porzio Park, and provided no additional gates. The new proposal, as yet not discussed with the community, provides

no buffer of noise and added gates, and represents yet another case of segmentation and yet a further violation of Environmental Justice principles.

(D) In addition to "segmentation" issues, the application of Section 4(f) is flawed. The DEIS should identify every 4(f) park resource adversely affected by existing Logan operations and any proposals under consideration. Communication should be established with the stewards of such 4(f) resources (typically city or state park agencies, and the neighborhood people who use the parks) to identify any impacts, alternatives to avoid, and "all possible planning to mitigate" such impacts. 193.15

(E) The assertion in the DEIS that soundproofing constitutes mitigation and somehow preempts the need to conduct a 4(f) analysis or an Environmental Justice process is totally inappropriate. Soundproofing of houses is at best a very partial mitigation of airport noise. Soundproofing doesn't help the porch, the roof, the backyard or the city sidewalk or neighborhood park. The existing house soundproofing program has been difficult to implement with middle income home owners. There is no track record on how to make it work for low income tenants. Indeed, there are questions of whether it is effective at all due to difficulty in holding contractors accountable for their work. There is no way that a vague Massport commitment to "mitigate" through soundproofing can substitute for environmental rights neighbors 193.16

enjoy under NEPA, Section 4(f), Title VI, which are supposed to be *strengthened and facilitated* by the Executive Order on Environmental Justice. 193.16 (cont.)

8) For all the above reasons, we believe the Massport DEIS is totally inadequate and needs to be redeveloped as a comprehensive Draft EIS for comment, which includes the Mass Highway Contract 8A, includes the proposed relocation of "Park and Fly" and the proposed airfield expansion into the "Robie" area; and further includes the proposal to redevelop Terminal A, so that the inter-related and cumulative impacts of these inter-related projects can be evaluated in a proper Draft EIS consistent with Environmental Justice principles. 193.17

(A) We believe that the process outlined by John DeVillars is appropriate, where first a comprehensive identification of existing impacts and appropriate attempts to avoid or mitigate would be identified and then any further proposals by Massport can be evaluated in that context.

(B) We believe that a revised draft EIS/R, incorporating the Mass Highway 8A Contract, including questions of airport edge such as relocation of the Park and Fly and the expansion of Logan Airfield into Robie, the redevelopment of Terminal A, and various airfield proposals including peak pricing should reject Runway 15-32.

1) The primary efforts that will deal with Logan delays are more use of regional airports and high speed rail. Even with no airfield action, adjusting the Massport numbers to reflect the growing success in regional airport and rail options suggests that delays should decrease, so there is no crisis here. 193.18

2) The availability of Runway 14-32 is likely to undercut the benefits of regional airport improvements, by providing small aircraft better on time performance than large, and encouraging a high-fleet scenario. 193.19

3) Runway 14-32 involves such a massive shift in overflight of communities, particularly over high concentrations of low income and minority populations that it violates Environmental Justice principles. 193.20

4) The presence of Runway 14-32 plan option so influences the affected communities that it is impossible to focus attention on improved instrumentation of Runway Approach 33, and other airfield issues that might be amenable to solution, and Terminal A 193.21

redevelopment which is the most urgent matter facing the ability of passengers to use Logan with reasonable comfort and convenience. 193.21 (cont.)

5) There clearly are feasible and prudent alternatives to building Runway 14-32, indeed, we believe the runway is *counter productive* on delay. In any case, adverse 4(f) impacts can be avoided by a decision to not construct Runway 14-32, and make the injunction permanent 193.22

Again thank you for your time and attention. We would be happy to meet again to discuss this further.

Code	Topic 1	Topic 2	Comment	Response
193.1	Regional Transportation	Regional Airports	The likely and potential role of regional alternatives to Logan is not properly assessed in the DEIS.	An expanded and updated discussion of the regional alternatives is presented in Chapter 2 of the Supplemental DEIS/FEIR. Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. By incorporating a broad range of current and future passenger traffic and aircraft operations scenarios, the airside analysis and recommendations encompass any reasonable future operating conditions at Logan Airport.
193.2	Analysis Assumptions/ Methodologies	Delay Model	...the delay estimates in Figure ES-3 on Page ES 19 and Table 4.2.7 on Page 4-11 do not make any adjustment for regional alternatives.	Variability in potential impacts from the regional airports on future conditions at Logan Airport is incorporated in the delay analysis through the use of a wide range of current and future passenger traffic and aircraft operations levels at Logan Airport. As a result, the recommendations contained in the Supplemental DEIS/FEIR are not dependent on a specific future environment at Logan Airport, but instead take into account a range of current and potential future passenger scenarios in addition to analysis of the current operating environment at the airport.

Code	Topic 1	Topic 2	Comment	Response
193.3	Regional Transportation	Regional Airports	...a substantial part of the outside of Route 128 metropolitan market, estimated as 28% of Logan's current market, would likely be attracted away from Logan by the combination of high speed rail, Green, Manchester, and Worcester.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR evaluate the T.F. Green/Providence, Manchester, and Worcester Regional airports and their potential impacts on Logan Airport. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the Greater Boston area. This will provide some relief to the growth pressures at Logan Airport. Nevertheless, the proposed Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. Successful development of the regional airports, enhancing their ability to attract passengers that originate trips from locations outside Logan Airport's core market area represents a key element in Massport's efforts to promote an effective and efficient regional transportation network.
193.4	Analysis Assumptions/ Methodologies	Passenger Forecasting	In the context of the "hassle factor" of getting to Logan; with several years of Big Dig construction, the necessary redevelopment of Terminal A, the high cost of parking at Logan, the limit on any growth in parking supply, it is reasonable to expect that the Massport DEIS substantially overestimates the likely growth in Logan passengers, and fails to consider aggressive further regional options as an alternative.	The Airside Project analysis compared the benefits and impacts of alternatives against a broad range of current and potential future activity levels at Logan Airport. A benefit of this approach is that the findings and selection of the Preferred Alternative were not dependent on a specific future condition, but reflect consideration of different scenarios. The analysis of comparative benefits for the alternative airside projects focussed on activity levels at 29 million and 37.5 million annual air passengers. These activity levels include diversion of up to 7.3 million passengers that could be absorbed by regional transportation alternatives. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach the 29 million-passenger forecast presented in the Draft EIR/EIR until 2002 or 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015. Regional alternatives are addressed in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. Increased use of regional alternatives will not prevent the substantial drop in capacity and resulting delays that occurs during northwest wind conditions.
193.5	Alternatives	Runway 14/32 Peak Period Pricing	...based on the analysis in the DEIS "overscheduling" of regional services will not occur with peak pricing, because the market incentive to oversupply with small aircraft will be diminished. Moreover, one might expect that construction of Runway 14/32 might lead to increased use of small aircraft, by improving schedule reliability of small aircraft in comparison to large, and perversely affect the total number of aircraft movements required to serve any given number of passengers. The failure to consider these effects result in underestimating the benefits of peak pricing, and overestimating the benefits of Runway 14/32, and is a substantial flaw.	Small aircraft can be accommodated on all the runway configurations used at Logan Airport. There is no basis to assume that the construction of Runway 14/32 would stimulate an increase in regional carrier operations. Additional analysis of PPP is contained in Section 4.5 of the Supplemental DEIS/FEIR. As a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
193.6	Analysis Assumptions/ Methodologies	Delay Model	There is a very little information about actual delay at Logan, and how it has increased or decreased over the years. ...there is no description of what impact...[the PACE program] had in less than a year, and no analysis of what impact it might have had if continued over a longer period.	Section 1.6 of the Supplemental DEIS/FEIR contains a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. Chapter 3 of the Airside Project Draft EIS/EIR also discusses the delay analysis and the PACE program.
193.7	Alternatives	Peak Period Pricing	There is no exploration of exemption or grandfather provisions to deal with any particular economic impacts in special markets such as the Cape, even though the regional office of the EPA specifically requested this analysis in 1995.	Refer to Section 4.5 of the Supplemental DEIS/FEIR which includes an analysis of PPP with the inclusion of a conceptual small community exemption program. That program would be designed to protect greatly affected communities from losing access to the national transportation system without unnecessarily diluting the delay reduction benefits of PPP.
193.8	Alternatives	Peak Period Pricing	There is no clear analysis of the 10% of Logan passengers in regional non-jet services who consume 40% of Logan airspace capacity, and how this particular part of the market is likely to evolve given existing growth in regional air services, and how these trends, might be expected to be affected by peak pricing and by the construction of Runway 14/32.	The presence of small aircraft in the fleet mix is a reflection of Logan Airport's role as a regional hub for both local and connecting passengers from small- and medium-sized communities in New England and the northeast United States. Logan Airport's normal operating capacity is 120 operations per hour and is available approximately 80 percent of the time. When these high capacity configurations are available, current flight demand can be accommodated with minimal delay. Runway 14/32 is designed to prevent the drop of capacity that occurs during northwest winds and will increase the reliability and efficiency of the airfield.
193.9	Alternatives	Peak Period Pricing	Essentially the peak pricing is likely to provide monetary incentives to airlines to produce (and passengers to prefer) improved regional services, instead of the congestion of Logan which now provides incentive for regionalization.	Since 1996, eight out of ten new passengers in New England are using the regional airports instead of Logan Airport. The regionalization of aviation in New England is already occurring without PPP.
193.10	Alternatives	Runway 14/32	By contrast, if Runway 14/32 is provided, an opposite incentive is introduced by giving small regional feeder service preferential on-time performance, at lower landing fees, but increasing delay for all the aircraft during the 80% of non northwest wind related delay. Additionally, by increasing the number of small aircraft at Logan, one would expect added delay due to vortex avoidance requirements, but that is not stated.	The fleet mix at Logan Airport is driven by the markets that the airport serves and not by available runway configuration. The construction of Runway 14/32 would not promote continued investment in small aircraft, since air carriers make their decisions on system-wide utility and profitability. Runway 14/32 would dramatically reduce delays under northwest wind conditions when small and large aircraft must use the same runway for landing. Under other conditions, the small and large aircraft are generally able to land on different runways so delay is minimal. The effects of wake vortex separations on operations and delays are included in all simulations. The High and Low Operations scenarios reflect different assumptions on the numbers of smaller aircraft for a given future passenger level. It should be noted that current and recent activity is consistent with the Low Operations scenarios. This Supplemental DEIS/FEIR includes analysis of a RJ High Fleet scenario, which includes a higher percentage of regional jets in the fleet. Also, refer to response to Comment 193.5.

Code	Topic 1	Topic 2	Comment	Response
193.11	Alternatives	Other Non-Construction Alternatives	There is no analysis of other regulatory means to encourage regional flight consolidation such as a "slot" system.	Neither federal or state scoping directives required an analysis of slotting. Imposition of slot controls constitutes a federal policy that has been preempted to the FAA under federal law and is not within Massport's jurisdiction. PPP represents a market approach that should encourage the highest value services to use Logan Airport during periods of scarce capacity without the market disruption and other inefficiencies related to slot control. Congress determined that the slot program has a number of significant problems. The U.S DOT has analyzed options for reducing slot controls at airports. As a result, the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR-21), which was enacted in March 2000, eliminated all slots at three of the nation's slot-controlled airports. Slots at New York LaGuardia Airport and New York JFK Airport will be eliminated by January 1,2007.
193.12	Alternatives	Other Non-Construction Alternatives	There is also no consideration of a system to manage delay whenever it occurs by prioritizing takeoff of larger aircraft over smaller.... Such a system would also be expected to have a long-range effect of encouraging direct service from regional airports to avoid Logan, and encourage consideration of regional non-jet flights into a small number of flights in larger "small jet" aircraft.	The air traffic control system of the United States, which the FAA operates, is based on a first-come, first-serve policy. Any change in this policy would require a major federal decision that would involve a major overhaul of the entire air traffic control system, including procedures, manuals, software, controller/pilot training, etc. The FAA is continually evaluating alternatives to increase efficiency of the national airspace system. However, future FAA initiatives will not eliminate the need for the proposed airfield improvements at Logan Airport. The FAA's national initiative will not prevent the decline in capacity under northwest wind conditions that occur at Logan Airport.
193.13	Ground Transportation	Access to Logan	There is not consideration of the ground access constraints at Logan, although the regional EPA specifically requested such an analysis in 1995.	The air passenger projections for the Airside Project are based upon the projections for the airport whether the Airside Project is implemented or not. Therefore, the Airside Project will neither positively or negatively affect the ground access situation at Logan Airport. Ground access patterns were studied in previous GEIRs and are discussed in the *1999 Logan Airport ESPR* (ESPR, previously GEIR). The ESPR was filed on December 15, 2000.
193.14	Environmental Justice	Cumulative Impacts	The Massport DEIS does not follow the Executive Order on Environmental Justice.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the Final United States Department of Transportation Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
193.15	Open Space/ Parkland	NEPA	...the application of Section 4(f) is flawed. The DEIS should identify every 4(f) park resource adversely affected by existing Logan operations and any proposal under consideration. Communication should be established with the stewards of such 4(f) resources...to identify any impacts, alternatives to avoid, and "all possible planning to mitigate" such impacts.	Section 4(f) requires the identification of resources that would be used by any alternative under consideration. Therefore, the identification of all park and historic resources currently affected by Logan Airport is not required for a Section 4(f) Evaluation. There are no parklands, historic properties or sites, or other Section 4(f) resources on the airfield in the area of the proposed runway and taxiway improvements. There are also no parklands identified in those areas where the 65 dB DNL contour for the Preferred Alternative extends beyond the 65 dB DNL contour for the No Action Alternative (Alternative 4). Therefore, the Preferred Alternative will have no direct or indirect impact on parklands. Refer to Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR for a discussion of parklands relative to the Preferred Alternative.
193.16	Noise	Soundproofing	The assertion in the DEIS that soundproofing constitutes mitigation and somehow preempts the need to conduct a 4(f) analysis or an Environmental Justice process is totally inappropriate. Soundproofing of houses is at best a very partial mitigation of airport noise. Soundproofing doesn't help the porch, the roof, the backyard or the city sidewalk or neighborhood park...There is no way that a vague Massport commitment to "mitigate" through soundproofing can substitute for environmental rights neighbors enjoy under NEPA, Section 4(f), Title VI, which are supposed to be strengthened and facilitated by the Executive Order on Environmental Justice.	The implementation of a sound insulation program for affected historic residences is the accepted FAA mitigation outlined in FAR Part 150. Refer to Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR for a discussion of Section 4(f) resources relative to the Preferred Alternative. Also, refer to the new analyses of Environmental Justice in Section 6.8 of the Supplemental DEIS/FEIR, and the expanded discussion of proposed mitigation in Chapter 8 of the Supplemental DEIS/FEIR.
193.17	Cumulative Impacts and the GEIR	Landside Improvements	...we believe the Massport DEIS is totally inadequate and needs to be redeveloped as a comprehensive Draft EIS for comment, which includes the Mass Highway Contract 8A, includes the proposed relocation of "Park and Fly": and the proposed airfield expansion into the "Robie" area, and further includes the proposal to redevelop Terminal A, so that the inter-related and cumulative impacts of these inter-related projects can be evaluated in proper Draft EIS consistent with Environmental Justice principles.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts. The other projects cited in this comment are not related to the Airside Improvements Project. Any impacts associated with those projects will be addressed in individual project filings, if required under NEPA and/or MEPA and also in the ESPR (formerly GEIR) process. The ongoing state ESPR process provides information to the federal and state agencies and the general public on the environmental effects of existing and future operations at Logan Airport, on the cumulative effect of airport operations, and on the planning context for individual projects at Logan Airport. The GEIR/ESPR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR as a background document.

Code	Topic 1	Topic 2	Comment	Response
193.18	Regional Transportation	Regional Airports	The primary efforts that will deal with Logan delays are more use of regional airports and high speed rail. Even with no airfield action, adjusting the Massport numbers to reflect the growing success in regional airport and rail options suggests that delays should decrease, so there is no crisis here.	The proposed Logan Airport Airside Project is necessary and provide clear benefits at current traffic levels. Massport has long recognized that service development and increased passenger traffic at the regional airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, especially high-speed rail to Logan Airport's largest market, New York. Section 2.3 of the Supplemental DEIS/FEIR evaluates T.F. Green/Providence, Manchester, and Worcester Regional airports and their potential impacts on Logan Airport. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport but will not eliminate the need for airside projects.
193.19	Alternatives	Runway 14/32	The availability of Runway 14/32 is likely to undercut the benefits of regional airport improvements, by providing small aircraft better on time performance than large, and encouraging a high-fleet scenario.	Regional carriers that provide service to Logan Airport and the passengers they serve are an entirely different market than the airlines that and passengers that have generated tremendous growth at the regional airports over the past several years. As a result, regional carriers serving Logan Airport are unlikely to shift operations to the regional airports and the low-fare carriers that provide service from the regional airports are unlikely to shift operations to Logan Airport. Regional carriers serving Logan Airport carry a mix of local and connecting passengers. A significant number of passengers are either traveling to Boston or connecting to flights that are not available from the outlying airports. For example, service to Manchester would not be a viable alternative for a Provincetown passenger traveling to a location in downtown Boston. Likewise, service to Providence would not be attractive to a Provincetown passenger trying to reach Denver, since there are no nonstop Denver services at T.F. Green/Providence Airport. Market forces have been responsible for the shift in airport usage from Logan Airport to the regional airports and the induced growth at the regional airports. Regional airports have become attractive alternatives to Logan Airport because of airline decisions to increase the frequency and quality of regional airport services (i.e., jet versus turboprops), the availability of lower airfares, convenient access relative to Logan Airport, and increased public awareness of the regional airports. Until Southwest Airlines, Delta Connection and MetroJet introduced low-fare services into the region, the New England region had been one of the only regions in the United States without a significant low-fare carrier presence. The resulting stimulation of traffic at the regional airports consists of both induced demand and diversion from Logan Airport. This diversion results from a recapture of traffic within Manchester and T.F. Green/Providence airports primary markets that was previously using Logan Airport. Since 1996, when low-fare services were first established at T.F. Green/Providence Airport, eight out of ten new air travelers in New England have chosen to use the regional airports over Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
193.20	Environmental Justice	Cumulative Impacts	Runway 14/32 involves such a massive shift in overflight of communities, particularly over high concentrations of low income and minority populations that it violates Environmental Justice principles.	There are no Environmental Justice violations as described in Section 6.8 of the Supplemental DEIS/FEIR. In fact, Runway 14/32 would reduce noise to those most impacted by noise. It would shift 75,000 flights over water, while reducing total number of nighttime flights. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
193.21	Alternatives	Preferred Alternative	The presence of Runway 14/32 plan option so influences the affected communities that it is impossible to focus attention on improved instrumentation of Runway Approach 33, and other airfield issues that might be amenable to solution, and Terminal A redevelopment which is the most urgent matter facing the ability of passengers to use Logan with reasonable comfort and convenience.	The Airside Project is designed to reduce delays and increase the efficiency of Logan Airport's airfield. Massport and individual airlines are currently undertaking redevelopment of the landside (*i.e.*, terminals, roadways, etc.) portion of Logan Airport. An Environmental Assessment/DEIR for the redevelopment of Terminal A by Delta Air Lines was filed with the MEPA Office on May 31, 2000. Each of these projects will provide important benefits and address immediate deficiencies and should not be delayed.
193.22	Alternatives	Runway 14/32	There clearly are feasible and prudent alternatives to building Runway 14/32, indeed, we believe the runway is counter productive on delay. In any case, adverse 4(f) impacts can be avoided by a decision not to construct Runway 14-32	There are no adverse Section 4(f) impacts associated with the Airside Project. The proposed improvements at Logan Airport will neither incorporate land from the Section 4(f) resource nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site. Therefore, the Preferred Alternative does not constitute a use of Section 4(f) resources. In addition, the FAA has determined that there are no feasible or prudent alternatives to the Preferred Alternative that would achieve the delay reduction, safety, transportation, noise distribution, and other objectives of the Preferred Alternative.

LETTER 194

Dear Mr. Pugsley:

I am writing you as a Cambridge resident opposed to the new runway, 14/32, proposed by Massport. Studies show that this runway will triple air traffic in our area. Wouldn't it make a lot more sense to start work on a new AIRPORT instead: one that is located further inland, where it would disturb fewer residents and would have more room to expand? In recent travels everyone I have encountered numbers Logan among the worst airports in the country, particularly in that it is nerve-rackingly hard to get to. 194.1

Thanking you for your consideration,

Yours sincerely,

Margaret Webster

194.1	Regional Transportation	Regional Airports	Studies show that this runway will triple air traffic in our area. Wouldn't it make a lot more sense to start work on a new AIRPORT instead: one that is located further inland, where it would disturb fewer residents and would have more room to expand?	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional Airports, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

John P. DeVillars
Regional Administrator
United States Environmental Protection Agency
Region 1
John F. Kennedy Federal Building
Boston, Massachusetts 02203-0001

Dear Mr. DeVillars:

Re: Comments on the Proposed Scope of Work for Draft Environmental Impact Statement/Draft Environmental Impact Report on Logan Airside Improvements Planning Project

It is my understanding that the uni-directional use of proposed Runway 14/32 cannot be legally guaranteed by the Massachusetts Port Authority, the Federal Aviation Administration or the Commonwealth of Massachusetts.

Consistent with their proposed use, Massport has analyzed Runway 14/32 as a uni-directional runway only. However, to better satisfy the aims of the National Environmental Policy Act and the Massachusetts Environmental Policy Act. the scope of the EIR/EIS should address the possible future implementation of bi-directional use. 195.1

Yours truly,

Arthur Krolman, CFA
President

Code	Topic 1	Topic 2	Comment	Response
195.1	Alternatives	Runway 14/32	Consistent with their proposed use, Massport has analyzed Runway 14/32 as a unidirectional runway only. However, to better satisfy the aims of the National Environmental Policy Act and the Massachusetts Environmental Policy Act. The scope of the EIR/EIS should address the possible future implementation of bi-directional use.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14 end. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

Boston, MA 02202

RE: EOEA #10458

Dear Mr. Pugsley,

I am writing to urge your agency to reject the proposed runway 14/32 project at Logan Airport. The residents of the communities surrounding Logan Airport have not been given fair consideration in this matter and will suffer greatly if this expansion is allowed to take place.

The Draft EIS/EIR statement released by Massport and the FAA focuses on the flight "delay" problem at Logan and attempts to solve this problem with the construction of new runway (14/32). However, the report contains numerous deficiencies that fail to compare the benefits of alleviating delays to the true environmental, social and medical costs of the proposed airport expansion:

Noise Pollution Impact
The widespread broadening of flights over many neighborhoods will increase noise impact to intolerable levels. Noise can cause serious health problems. It acts as a biological stressor by eliciting a response from the brain's reticular activation system that prepares the body for "fight or flight". Neural impulses then travel throughout the central nervous system and influence perceptual, motor, cognitive, behavioral, glandular, cardiovascular, and gastrointestinal functions. Therefore, noise is thought of as a *major* threat to human health.[i]

Air Pollution Impact
Chemical pollution generated by vehicles within the airport area, such as planes and transport vehicles, as well as road traffic to and from the airport will increase to unacceptable levels with the planned expansion. The EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that *any* increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult. [ii] 196.1

Construction Impact
The draft report maintains that construction period traffic during the 2000-2004 period will generate a daily average of 129 truck round trips (range 58-580/day). This increase in traffic load will go on for years and will add to the already overly congested roads that lead to and from the airport. This will disrupt the normal flow of traffic on affected roads causing traffic delays, increase traffic noise to neighboring communities as well as aggravate the existing pollution and particulate dust problem, and contribute to road erosion and structural damage.

Massport's reasoning for the construction of a new runway is to reduce flight delays. However, there is a legitimate question to ask:
Just how "delayed" is Logan Airport?
Conflicting figures from different agencies have been given - there is no consensus as to just what the exact problem is. The US Department of Transportation statistics concurs with Massport's data on flight delays. But

according to the FAA standards for calculating delays, Logan has only about 3% of its flights delayed[iii].. The FAA sensibly does not account for delays of less than 15 minutes or those that end up in flight cancellation. But, even if short delays are excessive, the US Department of Transportation confirmed that delays are not unusual for major airports, even for state-of-the-art facilities like Denver's Centennial airport, which had 29% of its flights delayed last year[iv]. According to FAA data, the delay situation at Logan has improved since 1993 and is essentially in equilibrium. In fact, Massport's Aviation Planning Director, Betty Desrosiers, admitted that delays have declined in recent years as airport planners improved scheduling with airlines. 196.2

It is clear that the Draft EIS/EIR raises more concerns than it alleviates. Logan is a physically small inner-city airport that has exceeded reasonable capacity. Expansion of Logan will only augment existing noise and chemical pollution levels for nearby communities. Most troubling is the disproportionate, biased, and significant increase in air traffic over low-income and minority communities of East Boston, Chelsea, Everett, and Roxbury, which is a violation of the Environmental Justice Act. 196.3

It is time to stop **all** expansion at Logan Airport and explore other alternatives. The interests of Massport must not be allowed to prevail over the interests of **hundreds of thousand of people** in the affected area. 14/32 is a detriment to our quality of life and a threat to our health and safety.

Respectfully,

Elizabeth A. Aberg

Code	Topic 1	Topic 2	Comment	Response
196.1	Air Quality	NAAQS	The EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that any increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult.	Although hazardous air pollutants (HAPs) are not specifically addressed, Section 6.8 of the Supplemental DEIS/FEIR includes a discussion of public health. Because VOCs and PM_{10} emissions are lower with the Airside Project than without it, it can be concluded that from these emissions will also be lower with the Airside Project Alternatives, when compared to the No Action Alternative.
196.2	Delay	Model	[The DEIS overstates the delay problem at Logan.]	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.
196.3	Environmental Justice	Impacts	Most troubling is the disproportionate, biased, and significant increase in air traffic over low-income and minority communities of East Boston, Chelsea, Everett, and Roxbury, which is a violation of the Environmental Justice Act.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

Content-Transfer-Encoding: quoted-printable

April 21, 1999

Dear Mr. Pugsley,

Enclosed is an Acrobat PDF file attachment of my Environmental Impact =
Statement regarding Logan Airside Improvements Project.=20

Massport has already spent close to $3 million in public funds on =
consultants and politically connected lobbyists to push for its airport =
expansion plan (Joe Battenfeld. Massport spent $3M to lobby for runway =
Logan. The Boston Herald. p1, April 14, 1999). And, we have just =
witnessed how quickly a generously funded business coalition with the =
obscure name of 'Citizens' for Efficient Regional Transportation, =
mobilized and picked up Massport's propaganda ads that tout the benefits =
of the new runway. This is an obtrusively obscene alliance between a =
public-sector agency, that is supposed to serve the interest of the =
people, and big business that shortsightedly doesn't mind running =
roughshod over everybody else in the name of 'profit'. Apparently, =
Massport doesn't mind mowing us down either. The Authority's spokesman, =
Jeremy Crockford, applauded these ads calling the first ad 'a good one' =
(Stephanie Ebbert. Business group buys ads touting runway. The Boston =
Globe. p B3, April 14, 1999).
I believe that 'profit' rather than 'delay' underscores the basis for =
this expansion. According to the FAA standards for calculating flight =
delays, Logan has only about 3% of its flights delayed. The FAA goes =
further by stressing that the delay situation at Logan has improved =
since 1993 and is essentially in equilibrium. Even Massport's Aviation =
Planning Director, Betty Desrosiers, admitted that delays have declined =
in recent years as airport planners improved scheduling with airlines =
(Stephanie Ebbert. Delays at Logan Seen as Overstated. The Boston Globe. =
p A1, April 3, 1999). Furthermore, the US Department of Transportation =
stated that delays are not unusual occurrences for major airports, even =
for state-of-the-art facilities like Denver's Centennial airport, which =
had 29% of its flights delayed last year.=20

197.1

EPA Regional Administrator stated that the region is currently in =
serious violation of the National Ambient Air Quality Standards for =
ozone, and that any increased traffic generated by the airport will make =

197.2

the Commonwealth's job of attaining the ozone standard more difficult.=20 197.3

Massport purports the draft report to be a full disclosure document. =
But, it leaves many details out and obscures the major issues that can =
potentially affect public health which deserves full public scrutiny =
nder The Massachusetts Environmental Policy Act (MEPA). As the project =
uld significantly increase Logan's airside capacity, the environmental =
nsequences would be extraordinary. The Conservation Law Foundation =
stated that "the (Massport environmental impact statement) paints a =
fairly frightening projection for growth at Logan'' (Laura Brown. =
Conservation Group Not Sold On Plan for New Runway. The Boston Herald. =
P. 15, April 16, 1999). In short, failure to see the environmental =
impact of the build option will condemn hundreds of thousands of local =
residents to living with deteriorating medical, social, and =
environmental conditions. Our communities have not been given fair =
consideration in this matter.

I respectfully submit that the permanent and long-term impact damage =
visited on local communities should not be brushed aside in favor of =
profit or for alleviating petty delays. And that any money earmarked for =
Logan expansion would be better spent on alleviating current levels of =
noise and chemical pollution felt throughout the local communities.=20

Sincerely,

Peter Alachi

SUMMARY OF MASSPORT'S AIRSIDE IMPROVEMENT PLANNING PROJECT

The Draft Environmental Impact Statement and Draft Environmental Impact Report (Draft EIS/EIR) considers the impact of five options on flight-delay reduction and weighs the environmental impact of each. The proposed schemes, called actions in draft report, comprise:

- Constructing and operating a 5,000-foot unidirectional runway (14/32) located at the southwestern edge of the airport for use over the water only. The runway length was selected over a 4,500-foot length in order to accommodate a greater proportion of the regional/commuter carrier fleet and therefore more effective in reducing delay (I:3-1).
- Constructing and operating a 9,300-foot Centerfield Taxiway between runway 4L/22R and 4R/22L.
- Reconfiguring, improving, realigning and extending other Taxiways
- Reducing approach minimums on some runways (15R, 22L, 27 and 33L) by providing precision approach guidance to a point closer to runway touchdown. This will reduce delays and enhance operational safety.
- Peak Period Pricing or landing fee surcharges imposed on carriers during peak flight activity levels and as a result of airline over-scheduling.

The planned project was picked from a list of 5 options or alternatives (I:ES-16 - Table 1).

TABLE 1 - SELECTION OF PROPOSED ACTIONS AND DELAY REDUCTION

Alternative	Proposed Action	Percent Reduction of Delay for Year 2010 per 37.5M Passengers (Low Fleet)	Percent Reduction of Delays for Year 2010 per 37.5M Passengers (High Fleet)	Status
1	All actions	-34.1%	-53.6%	Rejected
1A	All actions without Peak Period Pricing	-29.9%	-31.3%	Accepted
2	All actions without 14/32	-14.1%	-42.7%	Rejected
3	All actions (operational and administrative) but no build	-10.3%	-41.3%	Rejected
4	No actions - allows routine maintenance and annual minor improvements	-	-	Rejected

* Based on table 4.5-2 (I:4-30) and bar graph figure ES-4 (I:ES-19).

Peak Period Pricing was not considered since current flight activity levels and over-scheduling do not exceed current airfield capacity (I:3-39).

Construction traffic during the 2000-2004 period will generate a daily average of 129 (ES:ES-27) truck round trips (range 58-580/day). Routes 1A and the Ted Williams Tunnel will be used as the major gateways. Certain designated routes on State highways would "minimize the impact on local streets" (I:ES-29).

Runway 14/32 would be permitted to operate as a unidirectional runway with all arrivals and departures occurring over Boston Harbor. As a result 15% of total airport operations would shift from flight paths over communities to flight paths over the water (I:ES-4). Upon completion, the project will reduce impacts for the most severely noise-affected communities in East Boston, Revere and Winthrop (I:ES-30).

SUMMARY OF PROJECT ENVIRONMENTAL DATA

Logan Airside Improvements Planning Project (EOEA #10458) looked at 2 areas:

- Addressing Logan's delay problem
- Enhancing safety

The two plans will be achieved with *minimal* environmental impact (I:ES-5 - Table 2).

TABLE 2 - SUMMARY OF DRAFT EIS/EIR 'S ENVIRONMENTAL IMPACT AND MITIGATION

ISSUE	DRAFT EIS/EIR STATEMENT
Noise	1. 14/32 will provide more equitable noise distribution and mitigation measures to most affected communities. 2. Communities at 65 decibels will experience a noise increase of 2%. Soundproofing will be provided. 3. Proposed plan will not affect normal activity or aesthetic value of a public park, refuge or historic sites. 4. The Taxiway system will reduce ground noise.
Air Quality/Odors	1. Air quality will improve due to 14/32 added shorter delay periods, and the Taxiway system. 2. Ambient levels of Carbon Monoxide, Nitrogen Dioxide, and volatile Organic Compounds are expected to be well within the air quality standards and are below of all considered alternatives.
Terrestrial Vegetation and Wildlife Habitat	The runway and taxiway constructions will result in the total loss of 39.4 acres of vegetation, leaving behind a total of 440 acres. See also Table 5.4-1 (I:5-60) for a list of avian species within the Logan airfield.
Endangered and Threatened Species of Flora and Fauna	The construction of the Centerfield Taxiway between runways 4L/22R and 4R/22L will result in loss of upland sandpiper (Bartramia longicauda) habitat. A plan with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) will mitigate this impact.
Soils	The reportable concentrations of S1 and S2 soil categories were exceeded in some of the soil samples for arsenic, lead, and two polynuclear aromatic hydrocarbon compounds (I:5-71 and Table 5.6-1 - I:5-72)
Water Quality	Class SB water quality standards are being met under average conditions (Table 5.5-1 - I:5-66).
Wetlands	No federal or state wetlands occur within the airfield study area (I:5-58).
Construction Impact	The construction-related work will be alleviated through "initiatives to limit traffic, noise, and air quality impacts in surrounding communities."

RESPONSE NOTES

There are legitimate questions to be reckoned with as they pertain to nearby communities' expectations. Any Logan improvement should be done in a sensible manner that will not compromise the environment, impact further on our health, irreparably disrupt our lifestyles, or detract from our property values. The submitted report contains numerous deficiencies that fail to compare the benefits of alleviating delays and cutting airline costs to the true environmental, social, economic, and medical costs of the selected scenarios. This report weighs environmental and medical impacts as compared to delay impact.

• Noise Pollution Impact

1. One of the most frequent complaints of local communities' residents is noise. The FAA's threshold of 65 decibels does not accurately assess how many people are disturbed by aircraft noise. The National Resources Defense Council (NRDC) confirmed that Denver International Airport, despite the relatively few people living within its 65 decibel noise contour, receives the highest number of monthly noise complaints from outside this area[9]. Noise can cause serious health problems. It acts as a biological stressor by eliciting a response from the brain's reticular activation system that prepares the body for "fight or flight". Neural impulses then travel throughout the central nervous system and influence perceptual, motor, cognitive, behavioral, glandular, cardiovascular, and gastrointestinal functions. Therefore, noise is thought of as a *major* threat to human health[7].

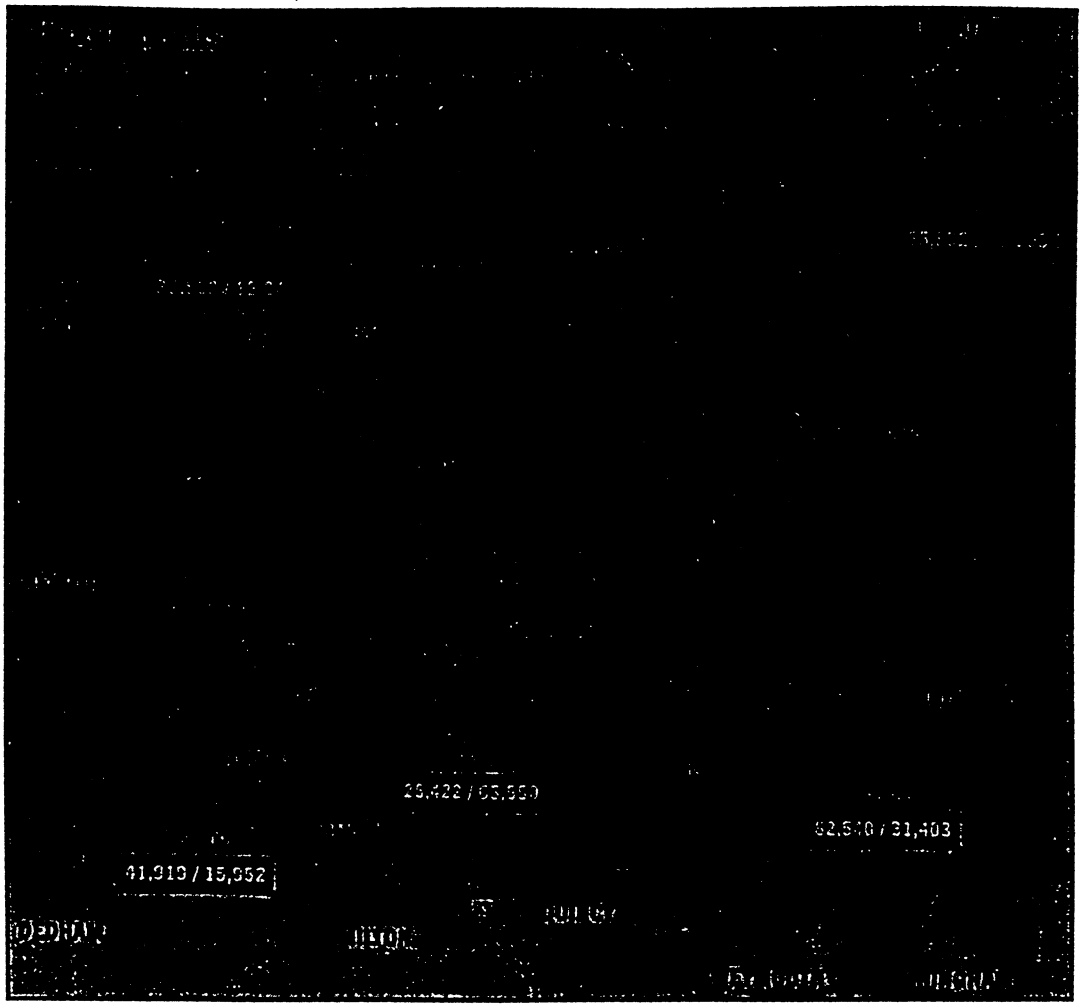
   The constant roar from jet aircraft can seriously affect the health and psychological well being of children, according to a Cornell University study[8]. Gary Evans, a professor of design and environmental analysis in Cornell's College of Human Ecology concluded that there are health problems resulting from chronic airport noise, including higher blood pressure and boosted levels of stress hormones, which may have lifelong effects. Evans contends also that New York children living near an international airport tended to be poor listeners and did not read as well as matched children in quiet schools. Mark Lawrence, an East Boston resident, who currently lives in Florida, recalls[13]:

   > "I REMEMBER being scared out of a deep sleep as a child as a jet would pass over my house so close you could see the pilot's face.
   > I REMEMBER how each year as a student all my teachers would have to pause every 5 or so minutes to allow the screeching jets to pass.
   > I REMEMBER not being able to concentrate in school because of jet noise."

   As many as 115 flights an hour pass over communities north and south of Logan Airport. In a joint public meeting by Massachusetts Environmental Protection Agency (MEPA) and the Federal EPA, Elaine McGrath of Chelsea told the board that, "The communities are speaking with one voice and telling you it's *unbearable*. Massport isn't telling you that"[19].

2. No remedy was given for the structural damage due to low-flying aircraft vibrating homes, school buildings, monuments, and industrial infrastructures within the affected communities.

3. The following flight path map obtained from the Boston Globe shows the projected impact comparing 1997, and 2001 with or without the new runway.



One obvious problem with this map's projections is that 14/32 will not be completed by 2001. According to a Massport spokesman, Jeremy Crockford, the approval process alone could take two years[20]. But a less obvious issue revolves around the increased fleet capacity projected by 2010. The numbers are therefore meaningless since those communities that are promised a relief for 2001 will not see it materialize in time and will be drowned by an eventual increase in total flights that supercedes the current level. Furthermore, if the plan is implemented, there will be a disproportionate and exorbitant increase in flights over poorer communities such as sections of Chelsea, East Boston, Everett, and Roxbury. The latter fact triggered U.S. Representative Joseph Moakley to argue that the impact statement did not address the environmental effects of the new runway on minority and low-income people in Boston that was required by a 1994 executive order issued by President Clinton[15]. 197.4

4. The Harbor Islands recreational area will suffer significant noise impact. 197.5

• Chemical Emission/Impact

Chemical pollutants emitted include cumulative chemicals generated by vehicles within the airport area, such as planes and transport vehicles, as well as road traffic leading to and from the airport.

1. Since the pollution emission predictor uses 1993 as a contrast item, an overcrowded airport year and a peak year for delays, the predicted emission reductions for year 2010 are undoubtedly minimized to favor a lesser environmental impact. Furthermore, the model predicts minor gains in reducing the levels of pollutants in the environment. But, the proposed action model predictor uses alternative 1 to attain this analytical profile (IV:Tables EI1-1-EI1-4). Since plan 1 was rejected in favor of plan 1A, these data do not necessarily fit the report's final conclusions (see Tables 1 and 3 in this report). 197.6

2. The additional combustion of gasoline and oil will increase the total Volatile Organic Compounds or Hydrocarbons (VOCs) in the atmosphere. VOCs are considered to be photochemical pollutants; a concentration of 3 ppm can result in 0.1 ppm of photochemical oxidants, a class of pollutants that includes both hydrocarbon and nitrogen derivatives.

3. The EPA's regional administrator stated that "... the number of passengers using the airport is projected almost to double current levels by 2010" (II:1). The projected increase in passenger volume to 45 million by 2010 will have an adverse effect on the local transportation and air quality by increasing the overall level of ozone in the airport region and on roads leading to the airport. Reducing ozone precursors, which includes nitrogen oxides is necessary to help the State attain the health standards for ground-level ozone (smog). Nitrogen dioxide (NO_2) is a pollutant that in concentrations as low as 0.25 ppm for one hour can blanket the horizon with reddish-brownish haze. Smog formation is initiated by the photochemical decomposition of NO_2 to NO + O. The resulting oxygen atoms then react with the more abundant species O_2 resulting in ozone (O_3). Oxygen atoms and Ozone molecules are also highly reactive with hydrocarbons, and a variety of products are eventually formed, including alcohols, ketones and aldehydes. The eye irritation, which is a familiar feature of photochemical smog, is due to the presence of compounds such as formaldehyde and acrolein. Both NO and NO_2 can also react directly with unsaturated hydrocarbons resulting in Methyl Nitrate and Peroxyacetyl Nitrate (PAN), both of which are powerful eye irritants[23].

4. Local airport traffic will also add to the problem of Carbon Monoxide (CO) emission. CO is found at normal levels between 0.025-1 ppm. In major cities, it ranges from 10-50 ppm. CO reduces the ability of the blood to transport oxygen though the body. The resulting strain on the heart and lungs can be fatal. CO can also cause dizziness, blurred vision, and distorted perception of time.

5. Sulfur Oxides, which occur chiefly as Sulfur Dioxide, Sulfur Trioxides, Sulfurous and Sulfuric Acids, can damage vegetation, fabrics, metals, and ecosystems such as lakes and ponds. Levels of 0.25 ppm or above cause irritation to human beings. Concentrations between 0.08 and 0.1 ppm for any length of time are considered unhealthy. It takes usually about 5 ppm of SO_2 for 1 hour to cause irritation to human throat and lung tissue, with accompanying bronchial constriction. But in individuals who suffer from chronic respiratory diseases, a minor increase in the concentration of SO_2 from 0.1 to 0.2 ppm can cause them to start coughing and experience severe difficulties in breathing[23]. Sulfur Dioxide is a heavy

noxious gas that can very quickly combine with water to form Sulfurous Acid (H_2SO_3). Also, Sulfur dioxide can absorb a photon of light and becomes "excited" so that if it collides with an O_2 molecule, it forms sulfur trioxide (SO_3). This is much more toxic than SO_2 and has much more affinity to water molecules in the atmosphere or lungs where it forms Sulfuric Acid (H_2SO_4), a highly corrosive acid. SO_2 emissions were not conducted since, according to the draft report, airports are not identified as significant sources of these emissions (I:6-64).

6. In addition, Sulfur compounds, Nitrogen Oxides, Lead, and various reactive volatile hydrocarbons can form other chemical complexes that are deleterious to all forms of life. These forms include a barrage of toxic and synthetic compounds whose effect on health ranges from clear-cut to suspicious. For example, NO_2 can combine with reactive hydrocarbons to form a wide range of pollutants including PAN, a major reactive pollutant. Some of these compounds are mutagenic and lead to cancer. Substances known to be cardiovascular irritants can directly be linked to emphysema, asthma, chronic bronchitis and heart attacks.

7. Suspended particles or particulates are tiny bits of matter (technically less than 0.1 millimeter) floating in the atmosphere, such as diesel smoke, fine ash, and dust. Particles which are smaller than 2.5 thousandths of a millimeter can pass through the primary, non-specific immune defenses such as nose hair and mucous membranes and may cause illness. Over a period of years, these materials attack lung tissue and increase susceptibility to such diseases as tuberculosis and lung cancer. And in urban areas, these particulates are believed to be responsible for increased asthma attacks, aggravating existing heart and lung conditions, lowering resistance to infection, and breathing problems in children. There is a direct correlation between high particulate air pollution and risk of premature mortality from heart and lung disease. The NRDC estimates that at current levels of pollution, approximately 64,000 premature deaths from cardiopulmonary causes may be attributable to particulate air pollution each year. That represents 6.5% of all cardiopulmonary deaths, which total 986,000 per year[9].

8. Many suspended particles serve as niche sites for microorganisms and their spores, including potential human pathogens.

9. High concentrations of suspended particles can cause reduced visibility caused by absorption and scattering of light. Soiled clothing and soot-covered buildings are other symptoms that are all too familiar.

10. Mixtures of atmospheric pollutants may show synergistic interactions, so that more aggregate damage is done by even small amounts than otherwise be expected. For example, the growth of pasture grasses is suppressed more by a mixture of SO_2 and NO_2 than by that of either alone[1].

11. Benzene, dioxin, toluene, xylene, and formaldehyde are known to be toxic and carcinogenic even at minute concentrations. None were monitored individually in the draft EIS/EIR study.

197.7

12. Overall health problems due to noise and chemical pollution include mental health problems, cardiovascular disease, gastrointestinal disease, compromised immune response, pregnancy and birth defects, learning disabilities, respiratory problems, and cancer[7].

13. Table 5.6-1 (I:5-72) indicates that the reportable concentrations of S1 and S2 soil were exceeded in some of the soil samples for arsenic, lead, and two polynuclear aromatic hydrocarbon compounds (I:5-71). Lead is known to be toxic in trace amounts. S1 soil category applies to those soils where there is a chance for a high frequency and high intensity of exposure to the soil by children and adults. While most of the lead assimilated comes from food and drink, some is inhaled. The residence time of lead in the bones is 78 years, whereas that of blood and soft tissue is about 30 days[6]. Lead emissions were not assessed by the draft report (I:6-64). 197.8

Ultimately, the lack of sufficient epidemiological and long-term health impact analysis due to these pollutants on people in affected communities is troubling.

TABLE 3 - COMPARISON OF DRAFT EIS/EIR ESTIMATES OF MAJOR AIR POLLUTANTS

Pollutant	Total 1993 Levels of Baseline Emissions for Logan (kg/day)	Predicted Low-Levels for 2010 (Alt 4/No Action)	Predicted Low-Levels for 2010 (Alt 1 - All Actions)*	% change from 1993 Levels with No Action (Alt. 4)†	% change from 1993 Levels with Action (Alt. 1)†
Carbon Monoxide	16,043	14,355	13,976	-10.5%	-12.9%
Sulfur Oxides	N/A	N/A	N/A	N/A	N/A
VOC	3,666	2,572	2,383	-29.8%	-35%
Nitrogen Oxides	5,002	7,078	6,919	+41.5%	+38.3%
Particulate Matter	241	280	251	+16.2%	+4.2%
Lead	N/A	N/A	N/A	N/A	N/A

* No data was given for the actual project (Alt. 1A)
† Negative data indicate a decrease in pollutant level while positive data indicate an increase.

- Construction Impact

1. The report claims no more than 0.6% overall impact on daily traffic due to trucking to and from the airport construction sites (I:ES-29). But the use of Routes 1A and the Ted Williams Tunnel will surely exceed that limit as hundreds of daily trucks enter and exit these roads. Furthermore, as to what roads are these trucks using to get to the aforementioned gateways, the report purports that 'certain' designated routes on state highways should be used to 'minimize' the impact on local streets (I:ES-29).

2. The draft report maintains that construction period traffic during the 2000-2004 period will generate a daily average of 129 truck round trips (range 58-580/day). The expected increase in traffic load will go on for years and will add to the already overly congested roads that lead to and from the airport. This will disrupt the normal flow of traffic on affected roads causing traffic delays, increasing traffic noise to neighboring communities as well as augmenting the existing pollution and particulate dust problem, and contributing to road erosion and structural damage. Nighttime construction will also occur. Winthrop's Office of the Board of Selectmen noted in a letter to Secretary Trudy Coxe, the Executive Officer

of Environmental Affairs, that "Past experience with other Logan construction projects has demonstrated their capacity to severely interrupt sleep patterns" (II:17.6).

- ## Endangered and Threatened Species of Flora and Fauna

1. The draft report mentions the loss of about 37 acres of existing grassland (I:ES-5) which is described in a later section as a net loss of 39.4 acres of "mowed grass" (I:ES-25), leaving behind 440 acres of vegetation. Of the 39.4 acres lost, 28.5 acres is due to the taxiway improvements, there is a 9% reduction in existing upland vegetation.

2. The loss of vegetation will result in loss of Upland Sandpiper (*Bartramia longicauda*) habitat due to construction of the Centerfield Taxiway between runways 4L/22R and 4R/22L. There is a mitigation plan with the Massachusetts Natural Heritage and Endangered Species Program (MNHES) to save the Upland Sandpiper. Michael Ciaranca, Natural Resource Manager of the Massachusetts National Guard stated that "... you can't simply (physically) move these birds and their nests to a different habitat."[17] Scott Melvin, from MNHES, concurred with Ciaranca that the current bird population and its nests could not be relocated but added that another site at the Massachusetts Military Reservation (Cape Cod) could serve as a new habitat that might conceptually be beneficial for the birds[21].

- ## Delays

1. The draft report chose 1993, a year in which flights peaked and Logan was overcrowded, as a base year for statistical comparison. In the short term (circa 1999), 29 million passengers were chosen to represent the fleet's annual passenger load. While for the long-term (circa 2010 and beyond), 2 sets were selected: 37.5 and 45 million passengers. At each passenger volume two fleet scenarios were analyzed, representing low and high-range levels of operation (III:Appendix E, p1). The benefits of Alternative Actions 1 and 1A were estimated to provide the greatest level of delay reduction with plan 1 reducing delays by between 29.3% and 60.3% (I:ES-18, and I:4-30). The draft report states that "a comparison of Peak Period Pricing (between 1 and 1A) under near-term, low fleet conditions is only 2 percent" (I:4-30). Table 4.5-2 shows that to be true. But, given the time-line for completing the runway, 1999 is not a realistic goal. Interestingly, the same table shows how the 'no build' option 3 under a high fleet scenario (with either low or high passenger loads) is much better at reducing delays than the 'build' 1A alternative (10% better for a low passenger load and 6.5% better for a high passenger load - see table 4.5-2, I:4-30). The EPA predicts a doubling of passenger capacity by 2010 at Logan (II:EPA Letter 1 dated Nov. 13, 1995), and Massport sees a 35.5% increase by 2010 (29 to 45 million passengers, III:Appendix E, p15), in which case the proposed plan will do little to alleviate congestion. 197.9

2. The Michael S. Dukakis Administration in 1989 imposed a form of peak period pricing which dropped congestion dramatically at the airport[2], thus, putting doubt on the draft report's contention that Peak Pricing is not helpful.

3. The US Department of Transportation statistics concurs with Massport's data on flight delays. But according to the FAA standards for calculating delays, Logan has only about 3% of its flights delayed[10]. The FAA sensibly does not account for delays of less than 15 minutes or those that end up in flight cancellation. But, even if short delays are excessive, the US Department of Transportation confirmed that delays are not unusual for major airports, even for state-of-the-art facilities like Denver's Centennial airport, which had 29% of its flights delayed last year[11].

4. According to FAA data, the delay situation at Logan has improved since 1993 and is essentially in equilibrium. Massport's Aviation Planning Director, Betty Desrosiers, admitted that delays have declined in recent years as airport planners improved scheduling with airlines[10].

CONCLUSIONS

- Massport often hides behind Federal aviation rulings and ignores community pleas to provide relief from daily disturbances living next to the airport (II:9.1). Typically, the draft report gave little to no serious attention to harmful noise and pollution impacts on the people in local communities, including residential neighborhoods, schools, parks, homes for the elderly, monuments, plants, and historic and cultural land. The proposed runway would adversely affect the noise and air quality in surrounding communities and seriously prevent or hamper many redevelopment efforts currently underway.

- The widespread broadening of flights over many neighborhoods would increase noise impact to intolerable levels. Studies indicate that noise affects one's ability to concentrate and can cause sleep deprivation, resulting in potentially deleterious effects on health and well being[7]. James Maas, professor of psychology at Cornell University and author of "Power Sleep", warned that getting enough sleep is more important than diet, exercise, or any other factor in increasing people's longevity[12].

- The draft's conclusions are drawn based on data models that fail to analyze true health impacts or to assess meaningful noise measurements. In fact, the Director of the Environment Department of the City of Boston stated that "... none of the scenarios presented can be considered to provide significant reductions in environmental impacts from airport operations. In particular, the proposed runway 14/32, touted for its unidirectional over-water approach/departure, is only marginally effective at reducing noise" (II:11.1).

- The EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that *any* increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult (II:1).

- While implementation of Peak Period Pricing was initially considered, the report claimed that "no US airport imposes a peak pricing system", and that "airline over-scheduling is not a significant contributor to delay under low fleet conditions or in the current or near-term environment at Logan" (I:ES-18). But, interestingly, the same report admits in a footnote that both New York and New Jersey Port Authorities apply a 'surcharge' to general aviation aircraft operating during peak hours. Furthermore, the Dukakis administration in 1989 imposed a form of peak period pricing which dropped congestion dramatically at the airport[2]. Recently, the Conservation Law Foundation weighed in against the runway plan, arguing that Massport could do more to alleviate flight delays by creating cost disincentives for airlines to fly at peak times[24].

- The Draft's attempt to 'divide and conquer' local communities by promising a balance in overhead flights is ill advised. In fact, the new runway and taxiway will allow the airport to grow beyond rational limits. Bennet Heart, a spokesperson from the Conservation Law Foundation, stated that "the (environmental impact statement) paints a fairly frightening projection for growth at Logan"[25]. Growth of Logan will augment existing noise and chemical pollution levels for nearby communities. Most troubling is the disproportionate, biased, and significant increase in air traffic over low-income and minority communities of East Boston, Chelsea, Everett, and Roxbury.

- The report often failed to reference the appropriate tables for the graphs shown. Given the amount of time we were allotted to provide a response, we spend precious time looking for raw data that were not referenced in the shown graphs (see bar graph ES-4: I:ES-19).

- It is clear from the data that there is no significant decrease in congestion or delays due to the proposed plan and that any minor decrease in delay is invalidated by the immense social cost to the neighboring communities. US Representative Michael Capuano wisely stated that "if 14/32 will not permanently reduce delays, we shouldn't build it. The detrimental impact on our neighborhoods is too great. The burden of proof is on Massport to explain why there is a need for 14/32 when it will drastically increase airplane noise in many communities and doesn't even represent a permanent solution to the problem."[16] Logan has reached its capacity. To obviate the build option, a regional solution should be adopted. It involves moving cargo traffic to regional airports, building a connector from Worcester Airport to MassPike, working to establish North/South rail link and services, and implementing Peak Period Pricing. Long term solutions should look into planning and building a regional airport with an eye on the origin-destination demand (Table 4).

TABLE 4 - LOGAN'S ORIGIN-DESTINATION DEMAND BY REGION

Region	% of Logan's origin-destination
Vermont	0.4%
Maine	2.8%
New Hampshire	7.4%
Connecticut	0.3%
Rhode Island	2.4%
Massachusetts, west of 495	8.8%
Massachusetts, between Rt. 128 and I-495[2]	**28.6%**
Massachusetts, inside Rt. 128 excluding Boston[2]	**28.6%**
Massachusetts, City of Boston	20.6%
Total	99.9

[1] Adapted from I:2-8 and Executive Summary Report:ES-10.
[2] Combined 57.2% of Logan's origin and destination passenger demand is drawn from these two regions.

- Massport purports the draft report to be a full disclosure document. But, it leaves many details out and obscures the major issues that can potentially affect public health which deserves full public scrutiny under The Massachusetts Environmental Policy Act (MEPA). As the project would significantly increase Logan's airside capacity, the environmental consequences would be extraordinary. Failure to see the environmental impact of the build option will condemn hundreds of thousands of local residents to living with deteriorating medical, social, and environmental conditions. These communities have not been given fair consideration in this matter.

- Given Massport's history at keeping promises[26], its current assurance[22] that runway 14/32 will be unidirectional is dubious at best (I:ES-4). The FAA and Massport can reverse this 'flight of fancy' promise at any time following runway completion.

- In the final analysis, Massport is putting a price on our heads. The Agency is gambling away the public's health in favor of alleviating what are mostly minor delays. As the level and cost of airport pollution climbs, Massport has made no apologies and has not addressed the long-term and cumulative impact of pollutants on our health and the environment in a satisfactory manner.

Massport's argument regarding the "Airside Improvement Project" is myopic: It concentrates more on the economics of cutting airline cost and business benefits but minimizes the tremendous environmental, social, and medical costs it is imposing on its neighbors. The true cost to society, in other words, is never measured properly. We respectfully submit that any permanent and long-term impact damage visited on local communities should not be brushed aside in favor of business 'profit' or for alleviating petty delays. And that any money earmarked for Logan expansion would be better spent on alleviating current levels of noise and chemical pollution felt throughout the local communities.

Code	Topic 1	Topic 2	Comment	Response
197.1	Purpose and Need	Delay	I believe that 'profit' rather than 'delay' underscores the basis for this expansion.	The Airside Project analysis shows that the Preferred Alternative will significantly reduce the growth in airside delays compared to the No Action Alternative. Refer to Section 4.6 of the Supplemental DEIS/FEIR. Massport will continue to examine ways to make Logan Airport more efficient.
197.2	Air Quality	NAAQS	EPA Regional Administrator stated that the region is currently in serious violation of the National Ambient Air Quality Standards for ozone, and that any increased traffic generated by the airport will make the Commonwealth's job of attaining the ozone standard more difficult.	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
197.3	Environmental Review Process	MEPA	Massport purports the draft report to be a full disclosure document. But, it leaves many details out and obscures the major issues that can potentially affect public health which deserves full public scrutiny under The Massachusetts Environmental Policy Act (MEPA).	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
197.4	Alternatives	Runway 14/32	...communities that are promised a relief for 2001 will not see it materialized in time and will be drowned by an eventual increase in total flights that supercedes the current level.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

Code	Topic 1	Topic 2	Comment	Response
197.5	Open Space/ Parkland	Noise	The Harbor Islands recreational area will suffer significant noise impact.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
197.6	Air Quality	Model	Since the pollution emission predictor uses 1993 as a contrast item, an overcrowded airport year and a peak year for delays, the predicted emission reductions for year 2010 are undoubtedly minimized to favor a lesser environmental impact.	1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame.
197.7	Air Quality	Model	Benezene, dioxin, toluene, xylene, and formaldehyde are known to be toxic and carcinogenic even at minute concentrations. None were monitored individually in the draft EIS/EIR study.	Current aircraft-engine emissions data do not allow accurate modeling of these pollutants. Although hazardous air pollutants (HAPs) are not specifically addressed, Section 6.8 of the Supplemental DEIS/FEIR includes a discussion of public health. Because VOCs and PM_{10} emissions are lower with the Airside Project than without it, it can be concluded that from these emissions will also be lower with the Airside Project Alternatives, when compared to the No Action Alternative.
197.8	Air Quality	Model	Lead emissions were not assessed by the draft report (I:6-64).	Lead, in general, is not associated with airport-related emissions.
197.9	Dalay	Model	The EPA predicts a doubling of passenger capacity by 2010 at Logan... and Massport sees a 35.5% increase by 2010 (29 to 45 million passengers...), in which case the proposed plan will do little to alleviate congestion.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

LETTER 198

Monika M. Corneille
26 Admiral's Way
Chelsea, MA 02150
617-261-8459

March 10, 1999

The Honorable John Kerry
United States Senator
One Bowdoin Square, 10th Floor
Boston, MA 02114

Dear Senator Kerry:

STOP 14/32

Please take notice that I strongly support the residents who reside in the vicinity of Massport in protest against the proposed Runway 14/32. 198.1

I am urging you to examine your thoughts and to weigh the catastrophic consequences the proposed Runway 14/32 will impose on tens of thousands of residents throughout the regions of Chelsea, Revere, East Boston, Winthrop and others. Please also consider the impact on the ecology of the surrounding areas. At a critical time, where we must consider long term impact in an attempt to preserve not only our generation, but also our children's, the runway carries particular weight. We know that the ecological balance will be seriously affected everywhere in an enormously large region. In addition, we know that airplane noise levels will reach an all-time, intolerable high. The noise levels, as they exist now, have already caused serious physical and emotional damage to certain adults. Add the proposed runway, and most certainly many more adults, children, and large varieties of animal life will be affected. On top of the above, the entire region will be infused with additional toxins, be it from additional airplane exhaust, more ground transportation or anything else.

At the March 2nd Subcommittee Meeting on Transportation at Boston City Hall, Mr. **Blute** of Massport made it very clear that he has no interest in the personal welfare of the communities involved. He made it clear, simply by not mentioning any such words as: family life, succession, quality of life, and ecology. What he did emphasize, however, is that his **interest in its entirety is purely economic.** He used these words: more jobs, more business, more industry, being competitive, etc. He pointed out that tourism and commerce (the new convention center) will be seriously affected if Runway 14/32 is defeated. As to suggestions of alternative airports, he pointed out that the airport should not be further away than where it is now, that regional airports will not be utilized by the multitudes of tourists. It would be too painful for these people, and nobody would visit Boston any longer. Hence, revenue is lost. I believe that one has to live under certain

Thank you for your support in this vital life issue for our communities.

Sincerely yours,

Monika Corneille

John O'Connor
April 9, 1999

LETTER 199

Dear John,

For your information, I posted the following message on www.stop1432 under Sinergistic impacts, in response to Mark Lawrence's idea of collaborating in collecting the negative impacts these noise levels cause. I can be reached on 617-884-4232 or on e-mail under mcorneille@dttus.com at work or 3542@MSN.com at home.

Dear Mark,

I have been reading with great interest what you have to offer on the subject of the RUNWAY. I think that a collection of how the flying alarm clocks impact us is a very good idea. I am willing to collaborate on collecting harms and problems arising from noise and other pollution. Perhaps these will get someone's attention. I know that lots of people suffer emotional and physical trauma from all of these.

I have lived at my current address in Chelsea since 1987, having been fully aware that I live close to an airport. However, I have not been bothered by excessive noise until about four years ago. I had lived abroad for two years and during that time the picture changed. Ever since I repatriated, November 95, I have been making calls and writing letters to legislative bodies, Massport and the FAA.

Here is what I now experience. I now get anxiety attacks from the aggravation of the steady wake-ups and having to call Massport noise abatement early a.m., late p.m., and the middle of the night, only to receive a stupid answer such as "you have been affected by runway 33L, blah, blah, blah." Regurgitating things I already know. They also don't take down verbatim what we say to them. They monitor our comments for "quality control". I have made it clear to them that it is not quality control they monitor, but what we say to them is what they monitor, so that our anger gets curbed. We all know that if we threathen them verbally in our upset stages and something happens one day, it is us who the fingers will point to because we are already on record. As a normally non-violent person, I have been verbally aggressive and nasty to the personnel taking the calls. They know me by name and voice. My daughter lives in Jersey and drives a long way to bring the grand children to see me. THEY CANNOT SLEEP WHILE HERE - I AM NOW FORCED TO GO THERE IF I WANT TO SEE THE GRAND CHILDREN. I think that for sure is negative impact.

199.1

Let's bring these problems forth!

Regards, Monika Corneille Monika Corneille

Code	Topic 1	Topic 2	Comment	Response
199.1	Noise	Impacts	[Current noise impacts in Chelsea are unacceptable.]	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.

LETTER 200

April 21, 1999

Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street – Room 2000
Boston, MA 02202

Dear Mr. De Villars;

It is with deep concern that I write you this letter. I am a resident in Chelsea, Massachusetts. The current AIR(Airfield Improvement Report) is not in the best interests of citizens living around the city of Boston.

Let me first say that I am in favor of economic growth and improvement in the Transportation systems of Boston. I believe in the improvement of New England, The Commonwealth of Massachusetts and the communities in and around Boston. I have lived in Boston and it's surrounding cities since I came here in 1986 to attend college. I have settled in Admiral's Hill in Chelsea with a purchase of a Beautiful Town House for two years with one major problem: Pollution of airplanes landing and taking off from Logan Airport.

I am continually disturbed and awakened from 6:00 AM to 12:30 AM from noisy planes flying overhead. My house shakes most of the time and I have a large double pane picture window with a huge crack across its width. This is a fact. Anything that can make these disturbances more frequent is completely unacceptalbe!

Any proposal must have the endorsement of the surrounding communities. The current Proposal is not adequate for the following easons: 200.1

1. FAA rules and guidelines were not followed. 200.2
2. Current data and studies were not taken into consideration
3. The originators of the proposal either have their own agenda or did not 'look outside the nine dots' and consider alternative ideas such as:

    1. A second major airport like: NY, LA, DC, Dallas, Houston, Chicago, SF/Oakland, etc.... 200.3
    2. Use of Hanscom Field Airport
    3. Regional Rail Transportation or other Modes of Transportation

This is very important to me as well as my neighbors. I ask for your help in making sure that our well being and safety are taken into consideration. I believe the politicians (Celluci, Birmingham, etc...) have been sold on this idea by big corporations and Massport. We need a Champion! Please! Before any more damage is done!

Very Truly Yours;

Louis DiSano

Letter 200
Louis P. DiSano
Private Citizens: Chelsea

Code	Topic 1	Topic 2	Comment	Response
200.1	Environmental Review Process	FAA/NEPA	The current proposal is not adequate for the following reasons: FAA rules and guidelines were not followed	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. This document addresses FAA rules and guidelines.
200.2	Analysis Assumptions/ methodologies	Base year	Current data and studies were not taken into consideration.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. The appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year.
200.3	Regional Transportation	Regional Airports/Passenger Rail	The originators of the proposal...did not... consider alternative ideas such as: 1. A second major airport... 2. Use of Hanscom Field Airport 3. Regional Rail Transportation or other Modes of Transportation	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields. A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions. Chapter 2 of the Supplemental DEIS/FEIR provides discussion of the entire region's air transportation system and includes a discussion of alternative modes, specifically, high-speed rail and the extent of Massport's active involvement in this area. Refer to response to Comments 6.6 and 6.7.

LETTER 201

Re: MassPort's Draft EIS/EIR (Logan Airside Improvement Planning Project ("Project")

The major obstacle to harmonious conflict resolution is the inadequacies of verbal (oral & written) communication ,e.g.:
I) each side unwittingly using identical terms for quite different meanings; with the consequence that both sides are partially correct and partially incorrect. But each side is only aware of their "correct " position and quite oblivious to, or tend to deny, their "Incorrect" points and the opposition's "correct" points.

II) Ambiguous terms which are crystal clear to one side but unclear, confusing, to the other.

Example of I above::

For rhetorical purposes a possibly theoretical case: a Chelsea City Councilor claims that Massports' predicted decibel contours have been and are wrong. Theoretical reality.: Massport opponents privately get decibel readings > 100. Massport claims 70. Opponents are using individual readings. Massport is using decibel averages. Maybe some readings did exceed 100 decibels but others were only 50 so average is 70. Both sides correct within their own context but incorrect in their opponents.

Examples of both I and II II above: A) unidirectional, B) capacity, C) quality of life.

A) Unidirectional - (Massport's meaning: "over the water,") Yet "unidirectional's" liability is its inevitable collateral bi-directionality; i.e.,the aviation version of "What goes around, - comes around.," "What lifts off. - must land." except for NASA space probes. But what lifts off 14 can't land there. It has to land on 9/27 or 15/33 Conversely what lands on 32 can't lift off there but also must do so on 9/27 or 15/33. That is the source of the increased flights over land.

Incidentally, "over the water" only solves the problem for densely populated areas off 9/27 and 15/33. But spend an hour on Long Island in the harbor when Logan is using 15 and 27 and you will experience the same debilitating effects as the densely populated areas. The only difference is that the population of Long Island is:

1) homeless,
2) Substance abusers
3) Pine St. Inn annex
4) Boston Fire Dept. Training area
5) Boston Police Dept. firing range.

201.1

So much for relative "quality of life".

B) Capacity

1) FAA - 200 operations/ hour 2) Massport- 120 operations/hour 3) Opponents - current operations/ hour. (A strict interpretation of the last criterion would mean that Logan was at capacity from the day it launched its first flight.)

C) Quality of life. How does one evaluate this? Is qualiity independent of quantity? or are they interdependent?
e.g. infrequent incursions on tranquility might not unduly desecrate a given "quality of life" whereas perpetual disruptions would completely destroy it.

Is this a dichotomy? or is there a transitional zone? And if so, how do you deal with it?

The above questions plague the controversy, yet need to be resolved to the satisfaction of all parties.- an extremely complex and frustrating task Hopefully the above makes a contribution to this challenge.

Respectfully submitted. Charlie Ferguson

201.1	Noise	Runway Use	"over the water" only solves the problem for densely populated areas off 9/27 and 15/33. But spend an hour on Long Island in the harbor when Logan is using 15 and 27 and you will experience the same debilitating effects as the densely populated areas.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.

Re: Hanscom/Logan

6 A.M.., Wednesday, April 14th, 1999

LETTER 202

My qualifications for speaking to the above titled subject are:

I flew a single engine land, tail wheel, fabric covered plane, naturally no de-icers, about 4 times/ year for 5 years from Lansing,Mich, across S. Ontario from Port Huran, Mich.-Niagara Falls.Invariably I hit lake effect weather in Ontario, blizzards in winter and cumulo-nimbus electrical storms the rest of the year

Twice I was forced down in Ontario pastures , fortuneately scaring cattle out of the way when landing and taking off. However, while studying my air charts and trying to determine my position the cattle would come and lick the fabric with their coarse tongues.I was afraid they would rupture it. .

Regardless, that was how I learned, not by trial & error, there was no room for error, but just dumb luck, how to jump a plane off a short field. Off course I had already learned in the same fashion, how to make a forced landing in short space.One of them was in late March with a wet snow falling. The snow loaded the leading edge of my wings so drag overcame lift. I could give it full take-off throttle and orientation but it would just mush along in level flight.

Another time I practically flew into the mouth of a hangar at Schenectady, NY, cutting the throttle and touching down rods from it. After refueling, 1 man sat on the tail while 2 others clung to the wing struts and they walked me a few 100 yards down the runway and turned me around, so I wouldn't ground loop.The man got off the tail , I gave it full throttle, the tail lifted off, the wingmen let go and I rose backwards like a hot air balloon, waving to my handlers as I rose. At 600' I made a U-turn and was on my way.

But I miscalculated. I neglected to allow for the fact that I would fly out ahead of the 70 mph tail wind, which I did shortly after take-off, over the Berkshires. My destination was Marlboro, but by the time I arrived it was too dark to land safely so I diverted to Hanscom, making my 1st ever landing there at night. I lacked a radio and navigation lights so they never even knew I came in.. So much for my flight experience

Both Hanscom and Logan squander their respective facilities. Planes which don't require the full runways should only be allowed one (1) take-off and landing/day; i.e., they could be based at those respective fields if that was convenient for their owner/operators, but do their business elsewhere.

There are 15, give or take a few, alternate regional ports which can handle probably at least 1/2 the traffic at both Hanscom and Logan ; Beverly/Danvers, TewMac, Lawrence, Nashua, Minuteman in Boxboro, Ft. Devens? despite Industrial Park and active military training base, could it still handle "touch & go's"?, Fitchburg, Long Hill? in Bolton, Sterling, Marlboro, Grafton, Norwood, Fall River, Otis and S. Weymouth. 202.1

Even discounting the de-commisoned segment of the ex-US Naval Training Station in S. Weymouth, most of the field and enough runway to handle smaller planes exist in Abington/Rockland. It is claimed that facility could interfere with Logan traffic. How did it manage when it was an active Naval Training Station?. or have planes grown larger and need more maneuvering space?.. Even so, it must be a mighty close call because it is not much closer to Logan than Hanscom, which bears no such complaint. 202.2

Bedford Depot on the old Bedford/Fitchburg rail line is 1.5 mi. from Hanscom. Active Lincoln Station with trains running to N Station frequently during rush hours, and regularly in between on the Fitchburg line, is < 5 mi. from Hanscom. Numerous options; bus shuttle service to both Bedford Depot and Lincoln. Three (3) Large Huey type passenger helicopter and Hover Craft routes; from Hanscom to Logan, and 1 loop each S & N. in the 128-495 corridor

Establish 2-way, incoming and outgoing, transfer stations at Goose Bay & Gander, Newfoundland, Guantanamo Bay, Hawaii and Anchorage ,AL.where U.S. arriving passengers could be Customized, i.e. pass customs, sorted for the appropriate destination, i e. Hanscom or Logan , and passengers departing H/L could be sorted for those respective transfer stations. .

Only Jumbo Jets, Huge heliocopters and Hover Craft would use Logan. The verticals, i.e., helicopters and Hover-Craft, could have their own vertical tube flight paths in the dead spaces between runways.. Would narrow tunnels under the runways for access to these vertical tubes be possible, or would the runways collapse under the impact of the Jumbo Jets? If so I believe thre is sufficient space to locate these "tubes" where no runways would require crossing.

Re: Hanscom/Logan

Conducting "touch & go's" at Hanscom is courting disaster! Not at Hanscom, but elsewhere. On a long runway you can make 2 "touch & go's" in 1 pass. Also the pilot surrenders control to the tower so s/he is not responsible. But once these pilots get their "wings" they will be operating primarily in and out of non-controlled ports, thus making them responsible for their own flight paths and those of other planes using the same field. They need to know the "rules of the air" and how to apply them. They won't learn that at Hanscom as long as the tower provides all this for them. They will only learn it thru experience at the non-controlled ports. Thus it follows that all "touch & go" practice should be done at the non-controled fields and not at Hanscom.

To summarize; only planes requiring the Hanscom and Logan long runways are allowed regular flight service at these 2 Massport Fields. Everyone else is allowed one (1) take-off and landing/day if they wish to be based at H/L but conduct their business at the respective alternate ports. .

202.3

Two (2) final ?'s which Massport should answer are:

1) Whatever became of the STOL (Short Take-of and Landing) Eastern Air Lines experiment of '69-'72?

2) What was the cause of the precipitous drop in activity at Worcester? e..g., why did it originally thrive if access is so poor? Was it the Mass. Pike giving quicker access to Boston? Wouldn't want history to repeat itself; i.e., revive Worcester only to have it wilt again like flowers in periodic droughts.

Respectfully, Charlie Ferguson

202.1	Regional Transportation	Regional Airports	[Massport should divert flights to]... Beverly/Danvers, TewMac, Lawrence, Nashua, Minuteman in Boxboro, Ft. Devens....	These airports are equipped to handle only general aviation activity, which represents 5 percent of Logan Airport activity. Most general aviation activity at Logan Airport is corporate jets and the destination of the passengers is downtown Boston.
202.2	Regional Transportation	Regional Airports	It is claimed that [South Weymouth] could interface with Logan traffic. How did it manage when it was an active Naval Training Station? ..or have planes grown larger and need more maneuvering space?... Even so, it must be a mighty close call because it is not much closer to Logan than Hanscom, which bears no such complaint.	Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport (as of January 15, 2000). Massport plays no role, however, in the decisions of private airlines regarding air service routes or service levels. As proprietor of Logan Airport, Massport's primary responsibility is to supply, operate, and maintain Logan Airport's infrastructure which includes the runways, taxiways, terminal buildings, parking facilities and access roads. As a recipient of federal airport grants, Massport must adhere to grant covenants that require it to operate Logan Airport in such a way so as to ensure access and availability for public use on fair and reasonable terms and without unjust discrimination.
202.3	Regional Transportation	Regional Airports	[To reduce congestion Massport should require]...only planes requiring the Hanscom and Logan long runways are allowed regular flight service at these 2 Massport Fields. Everyone else is allowed one (1) take-off and landing/day if they wish to be based at H/L but conduct their business at the respective alternate ports.	Refer to response to comment 202.1.

LETTER 203

Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge St.
Boston, MA.02133

Dear Mr. Durand:

I am opposed to the runway 14/32 expansion at Logan Airport. The time has come to "share the wealth" with other, wealthier communities like Lexington, Bedford, and Concord. Instead of building another runway at Logan, other sites should be used. I will not support any politician who panders to the wealthier communities. 203.1

Sincerely yours,

Patricia Grasso

RE: **Runway 14/32 EIR Public Comment**
Kowalczyk - 37 Winnisimmet Chelsea

Dear Mr. :

As a Resident and Home Owner in Chelsea, my specific request is concerning the environmental burden borne by my resident community. You are aware of the local traffic patterns and noise generated by the proximity of the MASSPORT's Logan Airport. I am requesting that the following be addressed in the EIR prior to approval:

- Local Traffic Patterns - The volume of additional traffic generated by the airport expansion should be specifically quantified and impacts on local traffic patterns should account for the fact that Chelsea bears the burden of the economic and time savings most commercial operators use in determining routing. Accommodations for the new tunnels and the central artery depression will have little impact on reducing traffic flow through Chelsea. Please include considerations for accelerating the approval for the Haul Road around Chelsea. 204.1

- Noise - The quantification and monitoring of noise will have little effect on any decision to expand the runway once the approval is given. Tangible mitigation of noise must be included in the EIR which specifically addresses the impact to our community. Recommendations for noise attenuation such as sound proofing windows or regional traffic pattern control to provide relief though allocation of fly over patterns during specific times are two opportunities to share environmental burdens. 204.2

My appeal to MASSPORT lacks the extensive documentation other opposition groups may have amassed during the EIR process. My appeal is with MASSPORT's conscious to respect communities such as Chelsea which will bear the burden of Project 14/32 while greater Boston realizes the economic benefits. MASSPORT is empowered with the public trust, the conscious of the common good. Rules and regulations not with standing, MASSPORT is faced now with an increasing balance of political and economic compromise. The EOEA faces the same pressure.

The economics of large public sector infrastructure is not new to engineers. What is new is the realization that environmental burden can be quantified. Subjective impacts such as vehicle traffic, noise, and air quality assume real dollar value. Historically these quality of life issues have succumbed to lack of technical measurement and political fillerbustering. Today as result of continuing public outcry to quantify the values assigned to these burdens, public agencies are less likely to compromise and endorse projects for mutual exchange among more politically savvy representatives. Today an educated public presents their own engineering opinions and requires increased accountability for the once sacred cow of best engineering judgement.

Apparently the message has been already been received by individuals who have expressed their opposition to MASSPORT's plans such our local representative, the respected Preston G. Galarneau, Jr.. Be that as it may, we have a long way to go before the values of environmental burden are equally shared and any proposal for a second airport within the Hub area is considered seriously. The underlying theme of "Jobs, Jobs, Jobs" has a way of influencing the most unbiased of candidates and in the end it will be our community leaders and representatives who decide and decide they will based on MASSPORT's and EOEA's negotiated concessions.

My opinion of the expansion plans for MASSPORT's runway 14/32 is one of many who have attended public meetings and written to you. But I am not empowered with the authority of decision. You are the authority. You are our conscious, our vested partner in the millennium to come, our overseer. You will decide the impact of the future environmental risk Chelsea will bear.

Understand full well that we are a community already burdened with environmental compromise - noise, traffic, air quality, parking, and sewerage. You and no one else will present your best engineering judgement of the values these burdens bear on our future quality of life. We all know your values will fall far short of any value Chelsea can express at this time. No one can measure the price of a compromised quality of life. We can only ask for our share of environmental equity. If history is any indication, the plans for any environmental relief follow a far different approval process when supported only by special interest groups lacking the driving economic pressure which industry will use to lobby approval of project 14/32. Chelsea has no other option than to lobby EOEA to make the mitigation proposals an integral part of the project approval itself. No other plan will be acceptable. Separating environmental equity from the economics of our regional politics will not be tolerated. If we are to suffer for the greater Boston Regional common good then let us be compensated for our burdens here and now with the approval process for 14/32.

204.3

Consider your options and know this, 'if EOEA's politically compromised understanding of the current environmental burdens borne by Chelsea is less than MASSPORT's economic gain then rest assured like our forefathers who boarded the British ships and tossed the tea into the harbor - the Residents of Chelsea will do the same on MASSPORT's runway'.

Thank you again for your time and understanding of our matters.

Very truly yours,

Joseph S. Kowalczyk, P.E.

204.1	Ground Transportation	Access to Logan	...The volume of additional traffic generated by the airport expansion should be specifically quantified and impacts on local traffic patterns should account for the fact that Chelsea bears the burden of the economic and time saving most commercial operations use in determining routing.	The Airside Project does not result in additional demand for ground access services. Refer to the *Logan Airport 1994/95 GEIR* which includes Massport's Ground Access Management Plan, targeted HOV shares, forecasted Vehicle Miles Traveled, and trips by mode for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis. The *Logan Airport 1999 Environmental Planning and Status Report* (previously GEIR) provides a status report on Massport's ground access initiatives and HOV ridership for 1999.
204.2	Noise	Mitigation	Tangible mitigation of noise must be included in the EIR which specifically addresses the impact to our community.	To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements.
204.3	Alternatives	Runway 14/32	Chelsea has no other option than to lobby EOEA to make the mitigation proposals an integral part of the project approval itself.... If we are to suffer for the greater Boston Regional common good then let us be compensated for our burdens here and now with the approval process for [Runway] 14/32.	Massport's mitigation measures are reinforced through compliance with M.G.L. Chapter 30A, Section 61 and through specific state and federal certificates approving projects that have mitigation. The status of the Section 61 Finding commitments are tracked and reported in the *Logan Airport 1999 ESPR* (previously GEIR). See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.

RE: **Runway 14/32 Expansion Plans**

Dear Mr. Secretary:

As a Resident and Home Owner in Chelsea, my specific request is for your office to consider the overwhelming environmental burden borne by the City of Chelsea. I am requesting that the following be addressed prior to any expansion plan is supported:

- Local Traffic Patterns - The volume of additional traffic generated by the airport expansion should be specifically quantified and impacts on local traffic patterns should account for the fact that Chelsea bears the burden of the economic and time savings most commercial operators use in determining routing. **Considerations for accelerating the construction of the Haul Road around Chelsea must be accelerated.** 205.1

- Noise - Tangible mitigation of noise must be included in the EIR which specifically addresses the impact to our community. **Recommendations for noise attenuation such as sound proofing windows are necessary even without the expansion.** 205.2

- Alternative Airports - Boston's infrastructure can no longer bear the burden of Logan's expansion demands. Alternative studies completed by Massport have erroneously written off Hanscom, Providence, Worcester, and Manchester Airports to support business and area growth by distributing the environmental burdens. **An "independent committee" must be assigned to develop their own opinion of Massport's 14/32 expansion using professionals and experts others than those now "coaching" Massports "findings".** 205.3

Please know that I support economic growth for Boston, the Commonwealth, and new England but not at my Community's expense. Stop the runway, investigate alternate airport expansions and support equitable sharing of the environmental burdens among the Commonwealth.

Thank you again for your time and understanding of our matters.

Very truly yours,

Joseph S. Kowalczyk, P.E.

To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements.

Code	Topic 1	Topic 2	Comment	Response
205.3	Regional Transportation	Regional Airports	Alternative Airports – Boston's infrastructure can no longer bear the burden of Logan's expansion demands. Alternation studies completed by Massport have erroneously written off Hanscom, Providence, Worcester, and Manchester Airports to support business and area growth by distributing the environmental burdens. An "independent committee" must be assigned to developed their own opinion of Massport's 14/32 expansion using professionals and experts other than those now "coaching" Massport's "findings".	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies have concluded that The Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high-speed rail are all necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of regional transportation alternatives to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999, attendance at a second summit in December 2000, and its assumption of operating responsibility for the Worcester Regional Airport in January 2000. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of Massport's initiatives in support regional transportation alternatives.

LETTER 206

April 22, 1999

Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202

Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Secretary Durand:

As a trustee of the 100 Captain's Row Condominium Trust of Admiral's Hill in Chelsea I am writing to voice the association's opposition to Massport's "Logan Airside Improvement Planning Project."

The Draft EIR/S contains many discrepancies and inadequacies and fails to address our concerns regarding the health impacts of a new runway on our neighborhoods. For the reasons detailed below, and we are sure many more, we encourage you to find this document inadequate and respectfully request the FAA withdraw support for the project. 206.1

It has come to our attention that the new runway will allow for a tripling of flights over Chelsea. Enough is enough! Our health is currently jeopardized by hundreds of thousands of vehicles travelling over the Tobin Bridge on one side, airplanes arriving and departing over head, a salt pile on another side, oil tank and asphalt facilities on our shores. and an onslaught of heavy truck traffic associated with all of them. We can not accept another assault on the quality of life in our neighborhood. 206.2

First and foremost, the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The real data, obtained by a permanent noise monitor located on Admiral's Hill, indicates we should be eligible for soundproofing based on current noise levels! The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely the noise impacts on our area. We also feel that soundproofing does little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park, does not help 206.3

us as we try to enjoy a sea breeze through open windows in the summertime and does not prevent us from interrupting conversation as we enjoy our pool area.

We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants – always has been and always will be. We believe it is not coincidence that we have been targeted with the brunt of the noise impact of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate. 206.4

Naturally we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included. Additionally, we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Why wasn't a second airport examined? 206.5

While Massport refuses to admit the Airside Improvement Planning Project will expand capacity at Logan, Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations. Nothing has been done to determine the traffic impacts associated with expected increases in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea. 206.6

Chelsea is undergoing a modern day renaissance. We have had to fight harder than most to turn the City around. As this proposal is being examined we are watching the value of our homes rise. We have a new school system and a local government committed to undoing the past. We were recently honored as an "All America City," in recognition for our ability to address the problems confronting us. Our budget is balanced for the first time, and we are investing millions in our infrastructure in order to move forward into the next century. The proposed expansion of Logan Airport is the single largest threat we face. If this runway is built, years of hard work could be undone in an instant.

Sincerely,

Karen Brown

Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate.

Naturally we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included. Additionally, we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Why wasn't a second airport examined?

While Massport refuses to admit the Airside Improvement Planning Project will expand capacity at Logan, Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations. Nothing has been done to determine the traffic impacts associated with expected increases in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea.

Chelsea is undergoing a modern day renaissance. We have had to fight harder than most to turn the City around. As this proposal is being examined we are watching the value of our homes rise. We have a new school system and a local government committed to undoing the past. We were recently honored as an "All America City," in recognition for our ability to address the problems confronting us. Our budget is balanced for the first time, and we are investing millions in our infrastructure in order to move forward into the next century. The proposed expansion of Logan Airport is the single largest threat we face. If this runway is built, years of hard work could be undone in an instant.

Sincerely,

John Marsh, III

Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Secretary Durand:

As a trustee of the Breakwater Condominium Trust of Admiral's Hill in Chelsea I am writing to voice the association's opposition to Massport's "Logan Airside Improvement Planning Project."

The Draft EIR/S contains many discrepancies and inadequacies and fails to address our concerns regarding the health impacts of a new runway on our neighborhoods. For the reasons detailed below, and we are sure many more, we encourage you to find this document inadequate and respectfully request the FAA withdraw support for the project.

It has come to our attention that the new runway will allow for a tripling of flights over Chelsea. Enough is enough! Our health is currently jeopardized by hundreds of thousands of vehicles travelling over the Tobin Bridge on one side, airplanes arriving and departing over head, a salt pile on another side, oil tank and asphalt facilities on our shores, and an onslaught of heavy truck traffic associated with all of them. We can not accept another assault on the quality of life in our neighborhood.

First and foremost, the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The real data, obtained by a permanent noise monitor located on Admiral's Hill, indicates we should be eligible for soundproofing based on current noise levels! The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely the noise impacts on our area. We also feel that soundproofing does little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park, does not help

us as we try to enjoy a sea breeze through open windows in the summertime and does not prevent us from interrupting conversation as we enjoy our pool area.

We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants – always has been and always will be. We believe it is not coincidence that we have been targeted with the brunt of the noise impact of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate.

Naturally we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included. Additionally, we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Secretary Durand:

As a trustee of the 100 Commandant's Way Condominium Trust of Admiral's Hill in Chelsea I am writing to voice the association's opposition to Massport's "Logan Airside Improvement Planning Project."

The Draft EIR/S contains many discrepancies and inadequacies and fails to address our concerns regarding the health impacts of a new runway on our neighborhoods. For the reasons detailed below, and we are sure many more, we encourage you to find this document inadequate and respectfully request the FAA withdraw support for the project.

It has come to our attention that the new runway will allow for a tripling of flights over Chelsea. Enough is enough! Our health is currently jeopardized by hundreds of thousands of vehicles travelling over the Tobin Bridge on one side, airplanes arriving and departing over head, a salt pile on another side, oil tank and asphalt facilities on our shores, and an onslaught of heavy truck traffic associated with all of them. We can not accept another assault on the quality of life in our neighborhood.

First and foremost, the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The real data, obtained by a permanent noise monitor located on Admiral's Hill, indicates we should be eligible for soundproofing based on current noise levels! The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely the noise impacts on our area. We also feel that soundproofing does little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park, does not help

us as we try to enjoy a sea breeze through open windows in the summertime and does not prevent us from interrupting conversation as we enjoy our pool area.

We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants – always has been and always will be. We believe it is not coincidence that we have been targeted with the brunt of the noise impact of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate.

Naturally we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included. Additionally, we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Why wasn't a second airport examined?

While Massport refuses to admit the Airside Improvement Planning Project will expand capacity at Logan, Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations. Code	Topic 1	Topic 2	Comment	Response
206.1	Environmental Review Process	MEPA	....we encourage you to find this document inadequate and respectively request the FAA withdraw support for the project.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
206.2	Public Health	Effects	[The proposed project would have adverse cumulative impacts on Chelsea.]	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
206.3	Noise	Model	...the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The real data, obtained by a permanent noise monitor located on Admiral's Hill, indicates we should be eligible for soundproofing based on current noise levels!	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR.* For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements.
206.4	Environmental Justice	Impacts	Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on [Chelsea].	The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Environmental and health studies relating to the City of Chelsea were reviewed to assess the potential for other cumulative or multiple adverse exposures, since the increase in population within the 65 dB DNL contour associated with the Preferred Alternative is primarily within this community. A review of issues within Chelsea indicated a concern regarding toxic discharges from industrial facilities, truck emissions, and contamination of Chelsea Creek. While it is true that sound insulation does not alleviate noise exposure outside, it is an effective technique that has been implemented effectively, not only at Logan Airport, but also at numerous other airports throughout the United States.

Code	Topic 1	Topic 2	Comment	Response
206.5	Alternatives	Peak Period Pricing	...we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Why wasn't a second airport examined?	The Airside Project analysis of PPP examined an operations threshold of 110 operations per hour, which is already below Logan Airport's normal operating capacity of 120 operations per hour. There is no legitimate operational justification for imposing a peak period surcharge at an operation level significantly lower than Logan Airport's normal operating capacity which is achieved 80 percent of the year without any delays. Even at 75 operations per hour, Logan Airport would be subject to delays from northwest wind conditions. The Airside Project analysis in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR indicates that, with the Preferred Alternative, Logan Airport can accommodate existing and foreseeable future levels of demand without imposing a drastic administrative restriction to artificially revise Logan Airport's existing capacity. Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.
206.6	Public Health	Effects	Nothing has been done to determine the traffic impacts associated with expected increase in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea.	Cargo activity, which is associated with truck traffic, is not expected to increase as a result of any of the alternatives.

LETTER 207

April 22, 1999

Secretary of Environmental Affairs: MEPA Office
Mr. Arthur Pugsley
100 Cambridge Street
2oth Floor
Boston, MA 02202

Re: EOEA No. 10458: Massport Runway 14/32 Proposal

Dear Mr. Pugsley,

Attached are my comments on Massport's Joint EIS/EIR on Runway 14/32, with appendices. I appreciate the environmental agencies' careful consideration of the public and community comments on this proposal. After careful review, I urge either the withdrawal of the plan or its rejection as a proposal that is inconsistent with the requirements of the National Environmental Policy Act, and unresponsive to the scoping directives of the secretaries and to the concerns of the public. 207.1

Sincerely,

E McGrath

Elaine McGrath
40 Beacon St.
Chelsea, MA 02150

Enc: Comments, w/7 Appendices

INTRODUCTION

Massport's Draft EIS/EIR on its 14/32 proposal is inconsistent with the letter and the spirit of the National Environmental Policy Act(NEPA).Furthermore, it has failed to respond to specific scoping directives in the Letters and Certificate issued by EPA, MEPA and DEP in 1995. 207.2

NEPA requires agencies to take a hard look at the environmental consequences of their proposals, and to conduct a detailed and thorough anaylsis of alternatives and to make this information available to the public. Massport has not done this. There are fatal flaws with its analyses of impacts, alternatives and environmental justice. The result is that this proposal gives the wrong impression of the human, environmental impacts of its current and proposed operations. The ground and air impacts of its operations are not extrememly limited or tolerable and Massport's mitigation is not as effective as they claim. The analysis systematically understates the noisy, unhealthful, dirty, dangerous and ugly aspects of Logan. 207.3

The proposal specifically fails to respond to directives intended to uncover these impacts, in the scoping letters of Secretaries Coxe and DeVillars, as well as DEP. Among Secretary Coxe's directives were: the need for the Draft EIS/EIR to be sensitive to the issue of environmental justice; detailed analysis of noise impacts; the need to address the effectiveness of alternative methods of achieving PRAS goals which do not rely on airfield improvements; the need for elaboration of the big picture issues regarding mitigation (Vol. II, C1-35). Secretary DeVillars emphasized the tremendous impact on communities and the region in terms of air quality, traffic and noise from Logan; the significant increases in cargo operations, with instructions 207.4

to assess the impact on Chelsea, and, in a related matter, asked Massport to evaluate major roadway intersections for air quality violations. The EPA also recommended that Massport fully disclose impacts to the communities and address mitigation options including restrictions on operations. (Vol. II, Letter 1). DEP emphasized parking issues in Chelsea (Vol. II, Letter 2.3). Massport omits many of these issues from its analysis, or simply evades the inquiry (see Vol. II. 1-12,2-3 Responses).

Regarding the analysis contained in the proposal, there are at least 3 critical flaws: systematic understatement of impacts, and related to this, failure to do a meaningful alternatives analysis or a sensitive environmental justice analysis.

IMPACTS ANALYSIS

Massport's impacts analysis understates impacts in a number of ways that have the cumulative effect of systematically minimizing Logan's impacts on the surrounding communities:

- -failure to account for the context and intensity of growth in airport operations, both land and air
- -unreliable modeling of impacts
- -inadequate and inaccurate monitoring of impacts and of mitigation
- -failure to report or take into account community feedback
- -persistent use of data known to be flawed, and unwillingness to correct mistakes
- -systematic and knowing selection of data so as to minimize the appearance of impacts.

207.5

The impacts analysis is essential to understand how a proposal will affect the environment and the people who live with the impacts. The context and intensity of the impacts are a first, crucial part of this analysis. Anyone unfamiliar with the communities surrounding the airport would be severely challenged to extract the big picture from this proposal, where information on the communities is buried in repeated PR for Massport's preferred alternative. Where is the accounting for the environmental damage in places like Chelsea, East Boston, Revere and Winthrop: the hundreds of thousands of passenger and cargo vehicles every day, the community disruption of hours of low-level landings and take-offs every day, every weekend, all day, and all night? To read this proposal is to wonder why Winchendon and Bedford and Concord were so upset at the prospect of an airport, since Massport asserts that overall, things aren't so bad and they're getting better, because of Stage 3 aircraft.

In the first place, as a matter of common sense, Massport's assertion that noise exposure from current flyovers is less and will be less than it was in the peak, baseline year of 1993, is symptomatic of the problem with Massport's credibility and the quality of its analysis. In 1993, there were 493,000 operations; in 1998, 507,000 (Vol. I, 1-9). Despite the increased number of operations, Massport claims that the noise exposure is less because of increased use of quieter Stage 3 aircraft (Vol. I, 6-9 amd passim). However, what they fail to highlight, but what their 1994/1995 GEIR states explicitly, is that Stage 3 aircraft are not appreciably quieter on landing and take-off, the noisiest operations which are the ones that affect the surrounding communities. Contrary to Massport's disingenuous assertions, Stage 3 aircraft do not and cannot reduce the noise exposure of the surrounding communities, which are bludgeoned with the noise of take-offs and landings; Massport actually admits this, in a buried paragraph in its noise analysis, which otherwise invokes the Stage 3 mantra (Vol. I, 5-24). For operations to increase by 14,000 will increase, not decrease noise exposure. 207.6

Another common sense problem with Massport's impacts analysis is its claim that routing 14/32 flights over the water will provide relief. Massport states, in a meaningful but too subtle way, that when 14/32 flights go over land, as they have to inevitably, they will over fly over communities now affected (Vol. I, 6-10). This means more impacts on already strained communities, not less.

Another basic source of understatement is more indirect: the use of outdated PRAS goals to justify impacts as "community-approved". This is misleading in the extreme. PRAS goals are repeatedly invoked as a justification for increasing impacts to certain neighborhoods, such as Chelsea, in an 207.7

attempt to achieve a "rough justice" of pain, by moving the problem of impacts around. However, these goals were developed in 1982-83 (Vol. I, 5-17,5-20), when airport land and air operations were a fraction of what they are now. Furthermore, it is inappropriate to call them "community-approved" in the face of community criticism of the way they were set and are used by Massport. In 1982, the number of operations was 275,000; in 1998, it was 507,000 (Vol. I, 1-9) In 1982, Massport handled 503,000,000 lbs of air cargo (think 18-wheeler trucks in your neighborhood!); in 1998, there were 970 MM (Vol. I, 1-9). PRAS goals also exclude non-jet operations (Vol. I, 5-18), and thereby do not account for all operations. In addition, the PRAS system has no ability to adjust automatically to changes in demand; whatever changes were made in 1996's "enhanced PRAS" to deal with this skewing is unclear from this proposal (Vol. I, 5-20,5-21).

Whatever choice community residents were given in the early 1980's regarding operational goals at Logan, the use of outdated PRAS goals when operations have risen 112% from 1977-1997 (Vol. I, 1-9), is not appropriate. It is a different orderof magnitude to absorb 30 or 40% of 275,000 vs. 507,000 operations. It is disingenuous of Massport to invoke such outmoded "community" goals in the face of the current volume of its operations, and the long-standing protests from communities that they can't take any more (see Vol. II, Letter 10). The communities have been clear that current operations impose unacceptable and destructive air and noise pollution on residents. The PRAS goals are not the community goals; the community goals are relief, "sufficient relief" (a Massport concept) from the nuisance of airport ground and air operations, the right to quiet enjoyment of their homes,which is guaranteed by law, and livable communities. Those are the community goals.

207.8

Any model is only an estimate. In addition to the above problems with inputs to its model, Massport's INM noise modelling has fallen short of actual impacts in several instances. (See, e.g., failure to follow ROD Runway 27 allocation, which undersated 65 dB DNL contours; Chelsea City Councillor Galarneau's Beacon St. monitor test at 70 DN_L in 1998; Vol. I, 5-24). The INM, state-of-the-art computer-generated noise contour map (Vol. I, 5-3,5-12, 5-15) stands in the face of experience to the contrary, and the deficiencies of Massport's modelling are only aggravated by its inadequate and amateurish monitoring.

In Chelsea, for example, the noise contour map asserts that no one currently, or for many years, has fallen within the 65dB cutoff (App. 1). The city itself has protested this as untrue (Vol. II, Letter 16). The numbers of people in Chelsea who are routinely subject to 65dB airplane noise are well above Massport's estimates, in several spots: the waterfront east of the Tobin Bridge, Admiral's Hill, Bellingham Square and the peak streets on the hills. Massport's modelling doesn't reflect this. Its monitoring either doesn't monitor thsese spots at all or else understates impacts by allowing monitors to do down without repairing them for up to 2 years (App. 2).

When and where monitoring has been done in Chelsea, readings are routinely in the 90-100 dB range (see App. 3), and meet the 70 dN_L standard for average noise (based on readings at Monitor 15 at Admiral's Hill, and readings from temporary monitor on Beacon St. in 1998). However, actual noise impacts are not adequately or consistently monitored at some hot spots, again depressing the impact numbers. For 2 years, Massport's noise monitor on Admiral's Hill in Chelsea was down, including the entire baseline year of 1993 (see App. 2). The same problem occurred for 2 weeks during the short period in 1998 when Councillor Galarneau had a temporary monitor on Beacon St.

Furthermore, noise impacts are also understated because monitors are not placed to capture the full impacts of Massport's noise and air pollution (see Vol. II, 31-45). Chelsea, for example, has only 1 noise monitor, on Admiral's Hill, and 1 air monitoring station, at the Soldier's Home on Powderhorn Hill. These hills are 2 of the high points in the city, each removed from the most severe impacts of Massport's operations. As planes take off or land, they pass over the waterfront at altitudes well below 300 feet and drop, or rise as they approach Admiral's Hill. The impacts recorded on the hill are less than what the waterfront residents experience, for this reason. The 18-wheeler blitzkrieg occurs outside the gated, truck-exclusion Admiral's Hill area, again on the waterfront. The air and noise pollution from hundreds of 18-wheelers on their way to the airport via the Beacon Street off-ramp, travelling through densely-populated 50-ft. streets every day, plus the millions of passenger vehicles to the airport every year, all travel through the waterfront area. This area is at the other end of Chelsea from the Powderhorn Hill monitor. The waterfront hot spot is simply not monitored; and Massport is allowed to claim that no monitoring means no impacts.

If you fail to maintain monitors in working condition for as long as 2 years, if you manipulate calculated vs. measured LDN values in your presentation of data (compare App. 2 with Vol. I, Table 5.2.4), and if you do not monitor noise hot spots, then your statistics are all skewed so as to minimize the true extent of impacts.

To arrive at its numbers, Massport has also disregarded another source of information that is a reality check on its modelling and monitoring: public feedback. In Chelsea,

and in other affected communities, residents have complained for years that impacts have been unbearable. One flight path tracks the street where I live in Chelsea: Beacon Street. Planes fly almost daily, and routinely on Saturdays and Sundays starting at 6 a.m., for hours (14.5 this summer was a record), often past midnight, and throughout the night. They fly at intervals of 60 seconds or less very often, and this is for hours. On the Chelsea waterfront, planes fly right above the roofs of 3-story 45-ft brick rowhouses. A Massport official at the Chelsea City Council meeting of March 3, 1999, stated that planes coming in for a landing over the waterfront (on 15R/33L) are at approximately 268 feet. They are closer than that to the roofs. The screaming, booming, thundering jet noises are painful and profoundly disruptive to normal life. It is impossible to hear someone speaking to you from 3 feet away. You cannot hear conversation, TV, music or yourself think; this is indoors. It is difficult to fall asleep or stay asleep. Brick houses vibrate. Bones vibrate. All the health effects of extreme noise exposure, and the consequences of constant triggering of the "flight or fight" response define the quality of life in the areas around the airport. Chelsea's waterfront is one of the oldest parts of the city, settled in the 1600's. Many of the rowhouses were built in the 1800's; the house where I live was built in 1865. These buildings were not designed to withstand the repeated impacts of jumbo jets flying overhead at less than 300 feet. The EPA goal of a DNL of 45 dB inside a home (Vol. I, 6-57) would be a welcome relief on the waterfront; of course, Massport chooses to use the significantly higher FAA standard of 65.

Massport officials know that more people in Chelsea are subject to much more noise than their modelling captures in the noise contour, or their 1 monitor shows. Massport

representatives, including Peter Blute and Betty Desrosiers, have conceded this as a matter of public record in Chelsea City Council meetings and at the presentation at the Chelsea YMCA on 1/19/99. But Massport has not let information get in the way of their analysis.

The failures of Logan's modelling and monitoring have been raised for years by many communities. They are known to Massport and the FAA, who do not reflect them in this proposal and did not respond to them in the "Responses" to Comments (see, e.g., Vol. II, 10.9, 13, 14.12, 16.6, 31.47, and Vol.1, 6.5). The agencies have in fact denied any community disruption (Vol. I, 6-5). Massport does not include in its proposal the persistent community protests, the noise complaint data from its hotline, or present in a coherent way its own track record of inaccurate noise measurement. Even protests from local, state and federal representatives are not used as a check for the numbers that Massport wants to use (see, e.g., Vol. II, passim). 207.9

Massport's modelling and monitoring fail to capture reality. Massport knows this. The communities have presented evidence for years that agreed-upon flight paths are not followed, that noise impacts are far worse than the imaginary noise contour maps suggest (it's not unusual for the map to draw the contour line in a place like the middle of Chelsea Creek), and that monitoring stations do not fully capture the real impacts of flyovers because of their inadequate placement and maintenance. As community residents consistently testified at the April 7 and 8 public hearings, they are much more disturbed than Massport will admit.

Despite the protests, none of the communities' pleas have persuaded Massport to revise its noise contour map, until

it was useful to do so as part of this proposal. In Chelsea, despite what Massport has conceded to be understatement of impacts, currently and for many years, no one in Chelsea fell within the 65 dB noise contour. Furthermore, the waterfront area, including Beacon Street, is not on the map under the 14/32 proposal (Vol. I, 5-3). This is so, even though Massport uses numbers of several thousands of people in Chelsea in the 65dB, up to the 75dB range, in its hypothetical 1993 baseline for the city.

207.10

Because of the way that Massport conducts its community relations, even complaints are low, although they do provide another useful check on Massport's numbers. The unwillingness of Massport to honestly report on impacts extends to the operation of the Noise Complaint Hotline. Community feedback has highlighted the many problems with this hotline: inadequate staffing (from 9-5 weekdays, there is a dedicated number; nights, weekeends and holidays, you are transferred to operations), the line is frequently busy or out of commission (especially during blitzkriegs), often hostile staff who argue with you or fail to take information correctly. My own experience is that it is a discouraging experience to even register a complaint, and that Massport makes it difficult. Often, details about the duration, frequency or height of flyovers is omitted through careless or intentional editing of complaints. Of course, this is important information that could be used as a check on impact numbers. Instead, people often experience the complaint hotline as "insult added to injury" and stop registering their complaints. With such hostility and frequent unavailability of the line, the extent of neighborhood disturbance isagain understated. It is worthwhile to remember that, as a rule of thumb, where

1 person has the gumption to complain about a disturbance, at least 10 others have been disturbed but have not complained. (See, for illustrative purposes, App. 4).

There are still more sources of bad statistics and understatement. One is the omission of significant data through failure to coordinate with other agencies with necessaryexpertise, such as the Department of Public Health, the State Transportation Department, including public transportation gurus and highway departments, or through failure to report available information. For example, in disregard of EPA and DEP directives (Vol. II, Letters 1, 1.12,1.15,2.3), Massport doesn't take into specific account the noise and air pollution caused by through drivers to Logan: 18-wheeler, Logan Equipment, passengers, parking lots. Cargo traffic grew from a 1981 low of 498,000,000 lbs to a high of 974 million lbs in 1997 (Vol. I, 1-9). This moves at night primarily, on cargo planes that fly between 10 p.m. and 6 a.m. They rumble like air cargo planes do, when they fly over at 4 a.m. (Vol. I, 1-10). Down at the ground, what this means is that the Chelsea and East Boston waterfronts, and parts of Charlestown, the North End,etc. have become truck routes for thousands of 18-wheeler long haul drivers, that run all day and nightthrough densely-populated residential neighborhoods. These are diesel trucks. The air and noise pollution from this operation, which Massport actively encourages, is not monitored. Readings by Massport/Tobin Bridge of truck noise on the Beacon Street ramp registered upwards of 100 dB, less than 30 feet from residences. The 1 air monitor in Chelsea from DPH is at Soldier's Home, as far away as you can get from the air and ground traffic to the airport. There's a concentrated impact area. It's not monitored. These impacts are not accounted for in the proposal, and they will only get worse if Logan's oper-

207.11

207.12

ations are allowed to increase. Of course, Stage 3 aircraft won't help with this. In addition to the trucks and drive-through flyers, towns become parking lots. 2500+ parking spaces for employees and passengers, 2 car rental lots, and an Official Airport Overlay District designation is a lot of presence. It should be monitored independently, perhaps with funding from Massport to DPH to do an epidemiology study (see Vol. II, Letter 45.8& work with DPH instead of passing the buck (Vol. II, 45.8). DPH is underresourced, the environmental agencies are strained financially. Residents have requested additional monitors (Vol. II, Letters 17.5 and 45. 8), and an epidemiology study. Massport, which has spent $3 million on PR and consultants, as well as budgeting $200,000 for an ad campaign, and which has contributed $100 million to the Big Dig, shouldbe able to fund a DPH assessment of health impacts in the surrounding communities.

207.13

As it is, Massport has failed to provide information requested in the scoping directives, or to inform the public about the consequences of Massport's operations. (See Vol. II, Letters 1, 1.12,1.15,2.3). The public has been in the position of informing everyone else of the real impacts.

Another unknown but overstated factor: the effectiveness of Massport's mitigation efforts, and the final source of understated impacts in this analysis. Massport's numbers are also low because of its incorrect assumption that its mitigation is effective. The proposal only mentions 1 test of the adequacy of Massport's testing of mitigation effectivess (Vol. I, 5-10), apparently of soundproofing of single rooms, the most extreme soundproofing done, in 1984!

Residents who have undergone soundproofing have complained

that it is ineffective against the planes, and that Massport has failed to honor its commitments to mitigate; one speaker on April 7, 1999 compared it to holding up a wet tea bag (Vol. II, Letters 14.12, 36). It's also unclear from the analysis, what percentage of the eligible population have even received it. (see Vol. I, 5-11-a total of 4602 units have been soundproofed without a breakdown of types of soundproofing or follow-ups on effectiveness, or # eligible.)

Massport does not reflect these complaints in its analysis of mitigation. The complaints mean that even where Massport has tried to mitigate its impacts, it hasn't been able to. Nor does Massport identify any measures to assess whether the soundproofing works (Vol. II, Letter 31.13). In Chelsea, double-pane windows are worthless against the noise of low-flying jets (and trucks). Earplugs don't always work. The most extreme measure offered by Massport is soundproofing of one room. It's important to realize that, even if effective, this would hold you hostage in your home. Only one room would be livable. Home life in 1 room, no community life, is not mitigation. It is not a reasonable solution to the problem of excessive plane noise to make people prisoners in their own houses. This is not the normal life through soundproofing that Massport asserts (Vol. I, ES-5, 5-10). 207.14

Because of all the elements that tend to produce understated impacts on the people who live around the airport, the agency has underestimated the number of people who live with 60dB, 70 dB, 80-past 100dB routinely; the air and noise pollution its total operations produce; the social, economic, health and esthetic damage it does. By not verifying its models, and failing to take into account information from residents, Massport has submitted an impacts analysis that is statistical nonsense. It is misinformation. 207.15

A second critical flaw in the proposal, and one affected by the faulty analysis of impacts, is Massport's failure to propose meaningful, reasonable alternatives and to conduct a thorough study and detailed description of them. This is in part a reflection of the bias in Massport's choice of "problem". Delay is as much a symptom of an airport operating beyond its effective capacity, as a problem per se. In fact, delay is only one of the problems at Logan. In 1993, the baseline year, Logan was the 6th busiest airport in the country. Air traffic controllers have made an issue of understaffing and inadequate equipment, leading to radar outages, a serious safety concern. (See App. 5). Noise and air pollution, traffic overload, parking lot sprawl, the threats to human health and safety, neighborhood degradation, and the failure to achieve a workable regional transportation policy, are all problems at and around Logan. 207.16

Logan has a nameplate capacity of 120 flights per peak hour. With 5 current runways, its current average 3-runway capacity during visual flight rules (VFR), is 120 planes per hour over 80% of the year (Vol. I, ES-16). Its annual average 3-runway capacity across all weather is 115 (Vol. I, ES-16). For the communities and Logan, even these numbers, so close to rated capacity, are too much, or we wouldn't be here on a proposal to increase capacity. Logan is subject to the constraints of wind and weather , which in turn are exacerbated by the volume of small planes using the airport, now 45% of the traffic (Vol. I, 4-5). By its own admission, almost 5 million people who drive to Logan every year are closer to other regional airports (an environmental crisis in itself) (Vol. I, 2-19).

Notwithstanding its stated intent to the contrary, the effect

of Massport's efforts, including the $3 million spent on PR and consultants, and an ad campaign at Logan and in the media, will increase the airport's capacity and "improve" that 115 statistic. (See Vol. II, Letters 10,39). Massport has given short shrift to everything but its preferred alternative. What its analysis demonstrates is a "straw man" approach to alternatives that might reduce its operations: a reluctant and ultimately rejecting consideration of peak pricing, a 1-paragraph dismissal of a second airport (Vol. I, 2-4), a competitive and grudging assessment of other regional solutions (in fact, the rail, regional airport and telecom "alternatives" can be considered part of the No Action alternative). No Action, while it is required as an alternative under NEPA analysis, is not a reasonable option for the communities, inconsistent with the goal of environmental protection, and not responsive to issues such as safety. To allow Massport to conduct this analysis without proposing a significant alternative to the growth of the airport is to make a mockery of NEPA. Whatever Massport thinks the capacity should be, community residents from at least 28 cities and towns have been vociferous in their many meetings with Massport and the FAA, in their noise complaints, and through their local, state and federal representatives, that the human carrying capacity in this area has been exceeded-a critical point left out of Massport's analysis.

207.16 (cont.)

207.17

This is not an alternatives analysis, as that term is ordinarily understood. For the public, as Betty Desrosiers' presentations made clear, there is no real alternative. Massport's promise is blunt: flights will come and go, more and more (22,000 more in Chelsea), the growth will be vigorous, and the only choice is whether this growth occurs with or without Runway 14/32.

Alternatives must be evaluated in terms of their context, the challenge of a reasonable transportation policy for Boston and the region. If the problem that Massport chooses to deal with is delay, at least one of its alternatives should focus on a solution that would solve delays while minimizing or avoiding environmental impacts. The environmental secretaries directed Massport to explore ways of accomplishing its goals without airfield improvements (Vol. II, ENF Cert.), and to consider operations restrictions as a mitigation measure (Vol. II, Letter 1.21). These directives are ignored or minimized in the alternatives analysis. 207.18

Massport has overlooked an important alternative that deserves consideration from both the airport and community perspectives. A meaningful alternative that would accommodate travelers and communities would be to reassess the effective capacity of Logan with the goal of shifting traffic now, and creating a well-functioning, right-size airport in the context of livable communities. It is not in the city's or the region's interests to reduce the quality of life in 28 communities, to destabilize areas such as Chelsea, or to impose additional environmental burdens on a population that is already pleading for relief. Airport capacities have been modified, and there is no reason those modifications cannot be downward, in line with public health and safety; business pressure and the convenience of the traveling public have to be secondary concerns to safety and health. 207.19

Using a workable capacity cap, Logan could reduce its delays and begin to remediate the environmental damage to the surrounding communities. This alternative would provide an incentive to reroute traffic to other airports that could accommodate them (the regionals have a market penetration rate of 51%- Vol. I, 2-21). The cap of 120 that Massport

aspires to, after all, represents a choice, a model really. It was set notwithstanding all the "constraints" that Massport claims prevent a new cap (see Vol. II, Letters/Non-Responses 30.08, 31.53, regarding caps and forcing mechanisms to shift traffic). Logan's capacity needs to be set at a workable level.

In addition to the above concerns about the "Preferred Alternative" alternative, I take issue with the analysis of Reduced Minimums as a method of reducing delay. Consistent with its goal to increase capacity statistics, this proposal would reduce the altitude minimums for when pilots could rely on instrument flight rules rather than visual flight rules, for landings (IFR vs. VFR). Currently, 1 of 5 runways is used for IFR landings. The proposal would extend IFR to 4 other runways. The FAA asserts that this would ensure the greatest availability of runways during poor weather, consistent with current industry practice for major commercial airports (Vol. I, 3-36). The critical difference from current practice, is that the current mimimums would be reduced by half, so that the point at which a pilot must see the runway will be closer than now.

This proposal ignores the fact that Logan is not like most major commercial airports. It's very small, it's surrounded by homes and downtown Boston, and its flight paths over these areas pass many hazards. Densely-populated residential neighborhoods come up to the airfield. Along the flight paths, planes fly over a major power plant, an LNG facility, several oil tank farms, the Tobin Bridge and 2 other bridges that are major thoroughfares into East Boston and downtown Boston, and hills. Whatever safety advantages there are to flying on IFR are cancelled out by the increased risks of flying over this terrain without a visual check.

207.20

Once again, a measure has been proposed without adequately considering the specific environment of this airport, rather than a modelled, hypothetical "major commercial airport". Many airports do not present the obstacle course that Logan's surroundings do. The extra measure of safety that VFR provides for these densely-populated communities is the real safety issue. As it is, the landings and takeoffs over the roofs of homes in Chelsea, East Boston, Revere and Winthrop are heart-stopping. There is no margin for error; we are already flirting with disaster.

The proposal admits that reduced minimums will have an insignificant impact on delay (Vol. I, 8-2). The real point of this alternative seems to be to boost the numbers of runways that can be used in adverse weather. That is, of course, precisely when you should not be flying over power plants, LNG and oil tank facilities, bridges and densely-populated residential ares at under 300 feet, without a visual check as well as every other kind of check you can manage. In 1995, Massport and the FAA did not respond to these safety concerns raised by residents (see Vol. II, Letters 12.1, 14.10, 30.1) The lack of awareness and respect for the surrounding communities that this alternative reflects is symptomatic of the myopia of Logan's planning. I urge the FAA to withdraw this proposal, or the reviewing agencies to reject it as inadequate in its analysis.

207.21

ENVIRONMENTAL JUSTICE ANALYSIS

Massport's Environmental Justice (EJ) analysis is also flawed. Both within the specific poverty and race guidelines of the Presidential Order, and a broader analysis based on the principle of proportionality, Massport's proposal fails the test of environmental justice. 207.22

Because this analysis is based on noise contour maps, its numbers are understated and unreliable. It is impossible to know from its analysis how many people who are minorities or below the poverty line (BPL) are disproportionately affected by its operations. Massport's noise contour map excludes significant numbers of people in Chelsea, including poor, minority and immigrant populations. For example, one of the areas in Chelsea most affected by Massport's air and ground operations is the waterfront, specifically the areas to the east of the Tobin Bridge. According to a study funded by EPA, these areas contain large populations that are BPL and minority (App. 6). These figures are not reflected in Massport's analysis, which has all the intellectual rigor of a schoolkid writing "There is no EJ issue here" 100 times on a blackboard. 207.23

There is another EJ issue that Massport fails to acknowledge. The principle of EJ is based on the notion of proportionality and the reality that certain populations are disproportionately affected by polluting activities. There is a huge issue of EJ having to do with the current, disproportionate impact of Massport and other government and private operations on the communities around Boston Harbor. 207.24

After 3 careful reviews, I cannot recognize my neighborhood in this proposal. Chelsea is the smallest city in the state. At 1.8 square miles, it suffers environmental assault out of all proportion to its ability to absorb it. Residents

experience: millions of passenger and commercial vehicles every month on the Tobin Bridge (2,000,000 vehicles a month@ Massport), and Routes 1 and 16 (within 50 feet of residences for the bridge), the downwind emissions of Sithe/Mystic Power Plant, one of the state's Dirty Dozen, an LNG facility on its border with Everett, thousands of 18-wheelers on residential streets carrying air cargo to Logan (an operation that Massport has encouraged, and that runs within 25 feet of residences on the densely-populated Chelsea and East Boston waterfronts, without any attempt by Massport to reroute it), the largest salt pile in the Northeast, which is uncovered and which supplies Massachusetts cities and towns/ running 18-wheeler dump trucks through residential streets in Chelsea), truck traffic to the New England Produce Center which supplies New England and eastern Canada, several oil tank farms, an asphalt facility, 44 c. 21E toxic sites, thousands of parking spaces on the waterfront for Logan employees and passengers, and lots of dirty businesses, such as recyclers of toxic materials. The public health statistics for Chelsea show elevated levels of illness and disease. The noise and air pollution is obvious and distressing on any visit to the city. Massport's proposal does not give you a clue as to this context and the role it plays in the continuing assault on the safety, health and quality of life for people who live in Chelsea. And this is the target area for Massport's improvements. Massport and the FAA are "committed" to maximizing the use of the runways that currently blitz Chelsea: 15R/33L,for late night flights in particular, between midnite and 6 a.m. (Vol. I, 5-12) and to run the greatest number of additional flights:22,000,overhead. To allow Logan to expand its operations, air and ground, through communities like Chelsea, is unconscionable. In environmental terms, it is to institutionalize a sacrifice area. No community should have to endure this.

207.25

Similarly, the other communities most affected by Logan's ground and air operations are also communities which bear more than their share of activities that nobody wants but everyone needs: the MWRA sewage plant (Winthrop), several major highways (Revere, E. Boston, Chelsea, Charlestown), the Callahan and Sumner Tunnels (E. Boston), a coal and oil-burning power plant (Everett and downwind communities such as Chelsea and Charlestown), the Tobin Bridge (Charlestown and Chelsea), an LNG facility (Everett), oil tank farms (Chelsea, E. Boston), thousands of parking spaces for Logan (E. Boston, Revere, Chelsea), MBTA bus depots (Roxbury), dozens of 21E sites and brownfields (throughout the area; 44 21E sites in Chelsea alone), the Big Dig (downtown Boston, Fort Point, North End),.....These are communities that have borne a disproportionate environmental burden for city and regional projects. As necessary as these projects are, the communities and the people who live in them have a limited capacity to absorb this environmental assault. To go from bad to worse, with or without Runway 14/32, is to go in the wrong direction. More of the same is not an environmentally sound policy or responsible community planning in this matter.

This entire context is omitted in Massport's analysis of EJ. Massport gives a very different picture of what is at stake. "Within the box" of Massport's analysis, the agency continues its m.o. of understating impacts and overstating benefits; it fails to give an accurate picture of the context in which growth is occurring. "Outside the box" of its analysis, there is a world of pain that Massport needs to take responsibility for: hours of screaming jets over residential neighborhoods, day, night, weekends, and holidays, at altitudes below 300 feet, excessive truck traffic in residential neighborhoods, millions of passenger vehicles overburdening an already polluted environment, and the destabilization and blighting of neighborhoods.

Instead, Massport informs us that 507,000 operations isn't enough, and that this traffic will increase dramatically, but that there will not be any cumulative impacts to speak of. This is not justice, it's nonsense, it's dumping. To allow Massport to grow beyond a well-functioning capacity makes it unworkable and makes the communities around it unlivable. This is just the situation that the principle of EJ is meant to address. It is no more acceptable to allow disproportionate impacts in areas with working-class, poor, minority, immigrant and diverse urban populations than it is to allow continued dumping in areas that meet the bright-line criteria of 50% of population BPL or minority. Environmental justice is an encompassing principle; a key element is the concept of proportionality and that is exactly what the areas around the airport represent now-disproportionate impact. We need protection from the destructive growth of Logan, with or without 14/32.

Massport must be given incentives to create a workable airport and to remedy neighborhood damage it creates. It does not, for example, consider increasing the percentage of Stage 3 aircraft despite its claims for them (Vol. I, 5.8), restricting night time flights despite the disturbance they cause (Vol. I, 5.9). Justice is not served by denial of impacts or inadequate mitigation. Justice is something that every community has the right to expect, whether it is in Winchendon, Chelsea, Bedford, E. Boston, Dover, Revere, Roxbury, or Winthrop. What would be justice for the communities around the airport?

CONCLUSION

The evaluation of this proposal cannot be solely about the terms that Massport and the FAA have set it in: delay. Delay is as much a symptom of the problem as the problem itself. The root problem is that, even operating at an annual average over all conditions of 115 operations per hour, Logan is operating beyond its effective capacity. For some time, it has been operating well beyond the carrying capacity of the communities whose residents eat its impacts. Even the airport has problems accommodating growth of 112+% over 20 years. Human beings simply can't take the air and noise pollution, the disruption of home and community life that has come with this explosive growth. This proposal needs critical attention and the communities need your protection, because at stake here is much more than the hypothetical $313 million delay costs to airlines and passengers and Logan's standing in the delay statistics. At stake is the livability of the 28 surrounding communities whose long-standing protests against Logan's environmental damage have been ignored. The goal of accommodating 120 flights per hour is a preconceived notion of what a safe, environmentally sound, workable capacity is for this airport in this place. Quality of life is not just a slogan for the people who live with the airport's impacts. In Chelsea, where I have experienced these impacts for several years, what is at stake is the viability of a community that is a sacrifice area otherwise, as far as polluters are concerned; and Massport is chief among those polluters.

207.26

Something is wrong when modeling and monitoring fail to reflect reality and do so in ways that systematically understate impacts. Something is wrong when an analysis fails to account for community feedback on the reliability of

your data. Something is wrong when an alternatives analysis gives us the choice of whether to accommodate growth that is beyond human and airport capacity, with or without a new runway. Something is wrong when an environmental secretary's directive to conduct a sensitive Environmental Justice analysis produces a 3 and 1/2 page mechanistic use of a flawed noise contour map to conclude that there is no EJ issue in areas known to be environmental dumping grounds for private and public business. Something is wrong when Massport's proposal provides disinformation, fails to respond to specific scoping directives, and produces a picture of local conditions that bears little or no resemblance to reality.

The communities need reliable information, remediation, and your protection (see App. 7). What needs protection here are the physical and human environments of the communities that suffer Logan's impacts. These communities have protested for years that the impacts are worse than Logan will admit, and that those impacts threaten the public health and safety.

What does not need protection here are business interests, which are highly elastic, and which have a flexibility that neighborhoods do not; they can and will adapt, market style, to shifts in operations, reduced capacities at Logan, or the need to go to another airport to get to Boston.

What also does not need protection here is the desire of Massport and the FAA to achieve a better standing in delay statistics. This is not a football game, this is a matter of how this airport will fit into this city, and the safety, health, economic, aesthetic and social impacts on people's lives.

Finally, this cannot be an exercise to protect the power of a government agency to spend $3 million plus of public money on PR, consulting and advertising in order to design a pre-ordained "Preferred Alternative".

What this proposal was supposed to do, but has not, was to accurately inform the public and the environmental agencies about actual impacts of current and proposed operations, propose meaningful alternatives including effective mitigation, and conduct a sensitive environmental justice analysis. Unless we hold Massport to basic standards of accuracy and comprehensive, reasonable planning, we allow a bad situation to get worse. We create a disincentive to create a responsive, imaginative solution to Logan's problems as an urban airport, And we condemnm the surrounding neighborhoods to further degradation, loss of community viability, and the disruption of health and quality of life. We need the informed environmental consideration that NEPA guarantees. Massport's record demonstrates that it is either unwilling or unable to account for the actual impacts of its operations or to remedy them. Among the information and initiatives that are needed are: coordination and funding of agencies to provide data on air and noise pollution and epidemiology, such as the Department of Public Health and the state transportation departments, especially the regional and highway departments; adequate and accurate monitoring of air and noise pollution in areas that reflect those impacts; consideration of improvements such as a ban on night flights and rerouting of passenger and truck traffic away from residential areas; a collaborative process that gives the communities a real influence over airport operations that affect them, and that reflects real alternatives to Logan growth as part of a regional transportation policy; and ways to ensure that there is

207.27

an independent, competent assessment of Logan's impacts. Massport has "...become the prisoner of (its) tactics, seldom looking behind them at the strategies." (Jane Jacobs, The Death and Life of Great American Cities, p. 322, Vintage 1992). Residents cannot afford such short-sighted planning. We need what Massport calls "sufficient relief", and this ain't it.

Given the defects in its proposal, it would be appropriate for Massport to withdraw it and go back to the drawing board for planning that will achieve a workable airport and livable communities. If Massport will not do that, I urge you to reject this proposal as inadequate, under NEPA and the scoping directives of the environmental secretaries. We can do much better than this. We have to.

"We cannot solve the problems we have created with the same thinking that created them."

Einstein

Table 5.2-5 summarizes the data for night time above (TAN) and 24-hour time above (TA24) for noise thresholds ranging from 55 to 95 dB. Note that the minutes in TAN are contained in those presented for TA24. These data give an insight into the statistics of the noise in terms of sound level and duration. The positions which appear to have the highest values of TA24, based on thresholds of 75 dB and over are NMS #s 4 (Bay View & Grand View), 5 (Harborview & Faun Bar), and 7 (Loring Road near Court) in Winthrop and NMS #s 9 (Bayswater & Nancia) and 12 (East Boston Yacht Club) in East Boston. These five locations also have the highest values of DNL. Further, the noise at NMS # 7 and 12 exceeds 55 dB for over 50 percent of the 15 hour day from 7:00 AM to 10:00 PM, and 65 dB for about 25 percent of the day. Both of these locations receive noise from operations on several runways.

APPENDIX 3

4/99 Boston Magazine:Massport Statistics on Max dB

friends established the Marblehead Cancer Prevention Project to combat some of their area's environmental hazards. "We were standing in her garden talking about how brave and amazing Norma had been when we asked, Why should we have to be brave? Why can't we be safe?" recalls *Boston Globe* columnist Linda Weltner, a Marblehead resident and one of the group's founders. "In that setting, we made a date to get together and talk about what could be done."

When the group of nine was founded a year and a half ago, one member had cancer, and is now in chemotherapy. Two have since been diagnosed—one with breast cancer and one with melanoma, both caught in the early stages. The cancer prevention group's cancer ratio is itself now an alarming one in three.

"Norma's activism spoke to a large number of people, and because of that, we had a great concern to keep it going. She was an instigator," says Christina Ryke, a group member who survived breast cancer in the late '80s. A few years ago, she was diagnosed with cancer again — this time, ovarian. "I had lived in a neighborhood where I felt there was a high incidence of cancer, and started writing down where people lived and what they had back in the late '80s. I found there was a lot of cancer in one little block. It's very intimidating, very scary. We are due for an enormous look at this because there's no question there's something happening."

THESE ARE THE KINDS OF STORIES AND STATISTICS THAT ARE increasingly catching the attention of people all over the country, and nowhere more so than in eastern Massachusetts. After all, it was here that ominous questions about the effects of environmental toxins were made larger than life by the book and John Travolta film *A Civil Action*, based on the plight of eight Woburn families who lost children to leukemia they believed to have been caused by trichloroethylene (TCE) in their water supply.

But Woburn is not the only area with a so-called cancer cluster, or potentially hazardous pollution. Nor are such problems limited to gritty industrial towns or low-income areas. Melanoma rates in Concord, Cohasset, and Orleans are even higher than in Marblehead. In Newton, an unusual number of residents have contracted cancer in a small area adjacent to a chemicals-laden dump. And Cape Cod has been recognized for years as an area dotted with cancer clusters, believed by some to be linked in part to a military base at the start of the peninsula.

"There's only one plausible explanation: There's something in the environment," says David Ozonoff, a physician and chair of the department of environmental health at Boston University. "The other two factors are genetics and lifestyle. There's no difference of lifestyle there—they eat the same crap there that everyone else does. And genetically they're not any different. It's not as if it's an isolated population in the Galapágos Islands. The only explanation here is that there's some factor or factors in the environment."

Scientific acronyms like TCE, PCB, and DDT are not just for scientists anymore: they're becoming household names as communities seek more information on the toxins in their towns that are suspected of causing sickness and death. Some are concerned about illnesses that seem to crop up in high numbers around their neighborhood, some raise questions about suspicious dumping sites nearby, and some are even nervous about effects of environmental hazards on their property values.

As public awareness grows, so does a hunger for information. The state Department of Public Health fields about 3,000 requests a year from concerned citizens asking for investigations of suspected cancer clusters, so many that the agency admits it can't keep up. "There's a triage system by which we try to determine which seem to be the cases most worth putting in time and resources," says Mark Leccese, the department's director of public affairs. "But at the same time, there are other unnoticed areas where we might have reason to suspect something even if the numbers don't suggest it. A certain illness or cancer might be at the expected level, but what if it all occurs in children born in the same year?"

In the adjacent foldout chart, *Boston Magazine* has juxtaposed statistics on some of the most common cancers with information about

APPENDIX 5

Boston Globe 6/18/98 ATC Article: Radar Outages/
Understaffing

Air traffic controllers tell of computer problems

FAA
Continued from Page A1

Radar outages worry air traffic controllers

By Matthew Brelis
GLOBE STAFF

Air traffic controllers directing planes flying at igh altitudes over New England and upstate New ork say that their radar screens have gone blank or ozen up almost daily since April and that there are ot enough technicians to keep the system running.

The cause of the malfunctions is a computer sys- m installed in 1972 that is failing with increasing equency.

While the Federal Aviation Administration ac- owledged problems with the computer system in e Boston Center and at other facilities around the untry, a spokesman said that the air traffic system s safe and that the agency has no records of daily lures.

Controllers and technicians, however, say the sys- n is being stretched to the breaking point.

"The system is falling apart," said William Johan- , president of the local chapter of the National Air affic Controllers Association, representing control-

FAA, Page A35

lers at the Boston Center in Nashua.

The most recent example of the problems came Tuesday afternoon, when a controller in Westbury, N.Y., momentarily lost track of Air Force Two's speed and altitude as the plane carrying Vice President Al Gore approached Newark International Airport. The DC-9 was 12 minutes from landing when crucial data – the plane's call sign, altitude reading, ground [illegible]nd angle of descent – disa[illegible] from the com-

Controllers rely on the computers and radar in their effort to maintain a safe distance between aircraft.

"The agency has now placed the national airspace system in jeopardy by allowing staffing in the radar unit to fall well below recognized norms," said Ed Dressell, the Boston Center's local president of the Professional Airways System Specialists, the union representing the technicians.

FAA spokesman Jim Peters said

'The agency has now placed the national airspace system in jeopardy by allowing staffing in the radar unit to fall well below recognized norms.'

ED DRESSELL
President, Professional Airways System Specialists

that safety has not been compromised by the computer failures. "Like any piece of equipment, you will experience problems on an intermittent basis," he said, adding that a back-up system has performed whenever the computer failed.

Peters also said a special team was assigned to the Boston Center to find the cause of the problems and fix them. An FAA document obtained by the Globe, however, indicates that any repair is at least six months away.

Peters also said the center has adequate manpower.

Two years ago, seven certified technicians worked at the Boston Center to keep the computer system running. Today only three specialists are assigned to maintain a system that has to run 24 hours a day, every day of the year. As a result, in the last month alone, the three technicians have been ordered to work more than 60 hours of overtime. One of the technicians is eligible for retirement and Dressell said "burnout is becoming an issue," as the hours required to service the aging system begin to increase.

The lack of trained technicians was caused partly by the retirement of many who were not replaced in the last decade because the FAA believed a new system would obviate the need for so many technicians. That new system, however, is still at least two years away.

On May 29, the technicians' union asked the FAA to declare an emergency situation at the Boston Center. That move would have been embarrassing but would have given the agency greater flexibility in staffing. Instead, the agency earlier this month called the repeated failures of the system a "substantial operational situation."

Meanwhile, Johannes said the outages have been occurring at an "alarming rate," and last anywhere from 12 seconds to two and a half hours. In 12 seconds, a plane can travel more than two miles. When longer outages occur, controllers use a limited back-up system, which requires a more time-consuming process to "hand off" a plane from one controller to another.

Controllers also are concerned that the back-up system may be down for routine maintenance when the primary system crashes. "If that happens, we won't have radar contact with anyone," Johannes said.

But, countered the FAA's Peters, even in that unlikely situation controllers would have radio contact with the airplanes and could slow all air traffic down considerably and increase the separation between planes to ensure there is no midair collision.

Air Force One, the plane used by President Clinton, disappeared twice in recent months from radar screens off New Jersey because of problems with the radar system.

"Air Force One is not the only plane disappearing from radar screens," said Scott Hayden, the local union vice president. "Unfortunately, these things happen every day to other aircraft as well."

Boston Globe 6/18/98

APPENDIX 6

11/96 EPA/Massachusetts Toxics Campaign Fund Study:
Industrial Pollution in Chelsea

INDUSTRIAL POLLUTION IN CHELSEA

AN ENVIRONMENTAL SURVEY BY

THE MASSACHUSETTS TOXICS CAMPAIGN FUND

November 1996

Funded by the U.S. Environmental Protection Agency

INDUSTRIAL POLLUTION IN CHELSEA

Summary

* From 1987 to 1994, as part of normal production, industrial companies in Chelsea reported that they released 666,188 pounds of toxic chemicals into the environment, or 83,274 pounds each year. Nearly all of this amount was released directly into the air. Over 95% of the air releases were made of three toxic chemicals: 1,1,1-trichloroethane, xylene, and toluene. These three chemicals can seriously damage human health. These companies are located mainly in the industrial area in the northeastern part of the city near Revere and the Chelsea River.
* Seven companies reported emergency releases of toxic chemicals (mainly fuel) during the 1987-1995 period. Some of these releases were very large. One was greater than 200,000 pounds of fuel. These companies are located mainly along Eastern Avenue and the waterfront area.
* Numerous other small, non-emergency releases of toxic chemicals took place, not only in industrial areas, but at several schools, too. High concentrations of lead and other toxins were turned up at the Williams and Shurtleff Schools.
* Chelsea is home to 44 toxic waste sites, also called "21E" sites, scattered throughout the western industrial area (near Everett) and the eastern waterfront industrial sections. Some of these sites contain hazardous waste, while most contain petroleum waste. These areas are known as "brownfields". Most of these sites are still far from being cleaned up.
* Chelsea's four biggest users of toxic chemicals used over 2.5 million pounds of reproductive toxins in 1993. These chemicals can damage the human reproductive system.
* Higher levels of pollution appear to be present in neighborhoods with a higher percentage of low income residents - particularly in low-income communities of color - while fewer sources of industrial contamination are found in higher income neighborhoods.

Scope of the Study

This study examines the extent of industrial pollution in Chelsea and its possible relation to socioeconomic status of Chelsea residents.

Lead poisoning is considered to be the main environmental health hazard in Chelsea, due to high incidence of older housing stock containing lead paint. In this study we do not quantify the extent of lead contamination and its health effects. We do recognize, however, the strong link between lead poisoning and a general lack of education about lead hazards and the lack of financial means among low income residents to have lead dangers removed.

Instead, we examine the extent of industrial toxic releases and their relation to socioeconomic status of Chelsea residents. Industrial and commercial pollution in Chelsea occurs in several ways:

1) As a frequent release into the environment from a factory or other business establishment. Businesses large enough are asked (voluntarily) to report what they emit into the environment each year to the U.S. Environmental Protection Agency. This information is compiled annually in the federal Toxic Release Inventory.

2) As an accidental release or spill. These are single events, not continuous or frequent releases over the period of one year, as is reported in the Toxic Release Inventory. Sometimes these releases are reported as an emergency, particularly if they are big. Other times, when they

are small and are not thought to pose a threat to the public, they are reported as non-emergency spills or releases.

3) As a "21E" waste site. 21E is a designation given by the Massachusetts Department of Environmental Protection to sites where significant amount of petroleum waste or hazardous waste have accumulated.

In addition, toxic chemicals used in production, and stored on-site at factories, are considered to be a potential health hazard, even if they are not actually released into the community.

Reported Toxic Releases from Industrial Production

According to the federal Toxic Release Inventory (TRI) Chelsea has experienced significant industrial toxic releases since reporting began in 1987. **Tables 1 and 2** show toxic releases from the Toxic Release Inventory for each year from 1987 to 1994. Total reported environmental releases have risen from 53,555 lbs. in 1987, to a peak level of 167,539 lbs. in 1989, then declining somewhat through 1992, before dropping off significantly in 1993 and 1994. Nearly all of the pounds released were released to the air.

The three major pollutants - 1,1,1-trichloroethane, xylene, and toluene - are chemicals which, at high enough levels, can seriously damage human health, including causing cancer. See **Table 3** for a brief description of the health effects from exposure to these chemicals.

The sources of this pollution are six industrial facilities. The largest emissions came from Emtex, Inc., and Glyptal, Inc., both located in the northeastern part of the city, near Chelsea Creek. At its peak, the largest polluter, Emtex (181 Spencer Ave.), released 140,844 pounds of 1,1,1-trichloroethane into the air in 1989 and 113,656 pounds into the air in 1992. Since 1992, however, there are no reported toxic releases from Emtex.

Glyptal (305 Eastern Ave.) released a peak level of 20,164 pounds of 8 chemicals into the air in 1989. Since then its releases have gradually dropped down to around 10,000 pounds in 1992-1994. The company's major pollutants are xylene and toluene.

Accidental Releases or Spills: Emergency and Non-Emergency

Seven companies reported emergency response releases or spills during the period of 1987-1995 (see **Table 4**). Most of these companies are located in the industrial areas along the Chelsea River. Nearly all of the releases or spills were gasoline or oil. Several releases were very large. Gulf Oil (281 Eastern Ave.) released 68,961 pounds of gasoline in 1992 and 13,200 pounds of kerosene in 1990. Amoco Oil (111 Eastern Ave.) released 203,000 pounds of fuel oil in 1993. B.A.T. Transportation (281 Eastern Ave.) released 15,250 pounds of gasoline in 1993. Coastal Oil (at Chelsea Dock) released 50,040 pounds of asphalt in 1994.

There were numerous smaller, non-emergency releases of toxic chemicals in the past several years alone, as documented by the Mass. Department of Environmental Protection. **Table 6** locates these smaller releases by census tract. Some of these smaller releases include heavy metals - such as zinc, copper, and lead - and relatively small amounts of fuel oil or petroleum hydrocarbons. Several releases are notable. The Shurtleff School (76 Congress Ave.) experienced a release of petroleum hydrocarbons (860 parts per million) and lead (490 parts per million) in June, 1995. There was a release of lead at a very high concentration (13,000 parts per million) at the Williams School (170-180 Walnut St.) in September 1994.

"21E" Waste Sites

Chelsea is home to 44 "21E" waste sites, as identified by the Department of Environmental Protection (see **Table 5**). Most of these waste sites contain petroleum waste, while seven sites contain non-petroleum hazardous waste alone, and 12 sites contain both petroleum and hazardous wastes. These sites are in various stages of clean-up (or "remediation"). But it appears that most of the sites are not close to being cleaned up. The waste sites are located at a wide variety of facilities, from the Williams School to Amoco Petroleum to Forbes Lithographic to the Chelsea Housing Authority. They are found largely in the city's western industrial area and the northeastern industrial area along the Chelsea River.

Many of these sites are considered "brownfields". This means that they are on vacant land, contain abandoned or vacant buildings, and have a slight or moderate degree of contamination. Brownfields are typically not seriously contaminated waste sites, such as a "Superfund" (as designated by the U.S. Environmental Protection Agency). Rather they are lands that could be put to other uses after an effective cleanup takes place. What should happen to these brownfields in Chelsea after they are cleaned up is an important issue.

Toxic Chemicals Used in Industrial Production

In addition to toxic releases and waste sites, many companies use toxic chemicals in their day-to-day production activities. **Table 7** shows the four biggest industrial users of toxic chemicals in Chelsea. Each of these companies also uses toxic chemicals which have been proven to cause reproductive damage in humans. Biltrite Corp., Emtex, Glyptal, and Marson Corp., together used 2,511,424 pounds of reproductive toxins in their production activities in 1993, as documented by MASSPIRG and the Greater Boston Physicians for Social Responsibility (1996). Reporting of amount of toxic chemicals being used or stored or produced at a facility is not a strict legal requirement; reporting is only voluntary. This means that numerous other businesses in Chelsea, especially small businesses, are probably using or releasing toxic chemicals without reporting it.

Pollution and Socio-Economic Status

The most significant industrial pollution sources in Chelsea are found in the city's eastern sections, in close proximity to residential neighborhoods, and in the sparsely populated western industrial section. The northeastern section of the city (census tract 1605) has the highest percentage of communities of color living below the poverty line. According to the 1990 Census (see **Table 9**), 49% of African-Americans, 50% of Asians, and 50% of Hispanics lived below the poverty line in Census Tract 1605. This tract experienced the highest level of continuous toxic releases (from the Toxic Release Inventory) (see **Table 8**). Also located in this section of the city are three auto body shops and two dry cleaners, potential sources of highly toxic releases which typically go unreported. In addition, a greater incidence of petroleum fuel spills and leaks occurred in this section than elsewhere in the city.

The two census tracts with the highest percentage of Hispanic residents, tracts 1602 and 1604, also demonstrated a higher incidence of toxic releases than other parts of the city. Percentage of Hispanics living below the poverty line was 41% and 47% in these two tracts.

Recommendations

1) The Chelsea Fire Department should check the Toxics Use Reduction chemicals (used in industrial production) against their files in order to ensure emergency preparedness.

2) Exact status of 21E waste sites should be made known to Chelsea residents by the Department of Environmental Protection. It is not clear as to how close to completion of cleanup each of these sites is.

3) There needs to be far better public access to information on industrial toxic hazards. The Department of Environmental Protection's online database is not yet very user friendly. Getting access to environmental information at DEP is a very time-consuming process; the average citizen does not have this kind of time.

4) The companies releasing toxic chemicals into the environment need to be tracked further. For example, whatever happened to Emtex, Inc., which was once (up to 1992) the biggest releaser of toxic chemicals into the environment in Chelsea. Emtex is no longer reporting. Did the company move? Better tracking is critical. The City of Chelsea should help track these companies and provide that information to residents on a yearly basis.

5) There needs to be a closer examination of the proximity of current residential neighborhoods and schools to industrial environmental hazards.

Note: For % of population, the percentages add up to greater than 100% because Hispanic respondents in the census sometimes considered themselves to be both Hispanic and white.

We need a pause the like of which we've never had in Western civilization. We need to halt at watershed junctures, like this one involving the disposition of Utah's public lands, and ask not only what is fair, just and reasonable, but what is enduringly wise.

The durable wealth of "public lands" lies beyond private bounty. Our principal task should not be to create new wealth but to manage the wealth we already have and which, for a variety of reasons, we cannot perceive.

In theory, publicly owned lands are publicly managed lands. In practice, the managing public comprises two opposing forces that government must reconcile: those with a specific economic interest and those without. As politics changes in the United States, one or the other of these two factions construes itself more (or less) influential in shaping public land policy. Neither group, of course, is ever in an unassailable position of authority, but public land decisions show a clear pattern. Land of little or no perceived economic utility tends to get protected; land showing any potential for economic profit—because it may support grass

or timber or may harbor minerals or water—is contested. (It is also true in an economy like ours that the imperative to develop inevitably forces a subdivision of the public land under consideration, thus ensuring that at least some land is always released for development.)

We need a pause in Western society because the decision to develop a stretch of public land can't be reconsidered, and at present, we're making these irrevocable decisions in preemptive, fearful haste. Nearly anyone who has attended a public land hearing, in which opposing sides square off over economic issues and what are quite accurately called spiritual issues, is appalled by the rudeness and contempt that often characterize testimony. A disinterested observer feels saddened and embarrassed by the witless rhetoric, the false airs and vituperative retorts, the blind allegiance of some individuals in government, in the environmental movement, in industry. Citizens who speak from their hearts instead of their wallets are too often dismissed by hearing committees as "irrational."

We are not, of course, in dire need of roads, transmission towers, dams, reservoirs, and gas pipelines. We are in dire need of courtesy. We are in dire need of a broadly intelligent conversation about human fate. We are in need of a thorough and piercing review of our plan for human economic development, a plan that at best is a hugely expensive speculation about human needs.

APPENDIX 7

Barry Lopez Article from Testimony-Writers of the West Speak on Behalf of Utah Wilderness 1996

We are not debating "wilderness" here in trying to decide the fate of Utah's undeveloped public lands. The term is too restrictive. We're debating the future direction of Western civilization, and our issue could not be more serious. A brutal, pointed lesson of human history is that unhealthy civilizations die. Civilizations that are physically, spiritually, or economically corrosive fall apart. Their people wither. If we do not want to pass away as a civilization, let alone as a Western nation, we need to recast our discussion so that it is this, not "wilderness," that is at stake. We need to see what a grave decision the release of public land for development is. If our central concerns remain who "wins" in these disagreements, or what sorts of "concessions" will please the most people, twenty years from now we'll be looked upon as fools. In a moment that called for discerning intelligence, we will be seen as people who settled for a fight over control, a venal and pedestrian aspiration.

The wisest thing now, it seems to me, is to regard undeveloped lands as an asset and to protect every acre of land possible. American culture, more than any other in the world, has been shaped by the image of private exploration of public land. The opportunity to still have that experience is deeply important to our sense of hope. And what you might call the principal, what's left in the account, is down to a pittance.

If we do not take the time now to understand where the diminishment of wilderness in America is taking us, the day will soon arrive when it will not matter. We will have given up a vision of heaven to bet we're not embarked on a trip to hell. The United States is a nation of staggering wealth. We can easily afford to conserve what we've been given and to wait patiently for a wisdom that so far has eluded us, a wisdom that will enable us to convey this gift, not simply consume it.

207.1	Environmental Review Process	FAA/NEPA	...I urge either the withdrawal of the plan or its rejection as a proposal that is inconsistent with the requirements of the National Environmental Policy Act, and unresponsive to the scoping directives of the secretaries and to the concerns of the public.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
207.2	Environmental Review Process	FAA/NEPA	Massport's Draft EIS/EIR...has failed to respond to specific scoping directives in the Letters and Certificate issued by EPA, MEPA and DEP in 1995.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
207.3	Environmental Review Process	FAA/NEPA	NEPA requires agencies to take a hard look at the environmental consequences of their proposals, and to conduct a detailed and thorough analysis of alternatives and to make this information available to the public. Massport has not done this. There are fatal flaws with its analyses of impacts, alternatives and environmental justice.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. A total of twelve meetings were held. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts.
207.4	Environmental Review Process	NEPA/MEPA	The proposal specifically fails to respond to directives intended to uncover these impacts, in the scoping letters of Secretaries Coxe and DeVillars, as well as DEP.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental DEIS to address specific issues identified by the FAA following input from an Panel consisting of six persons. At the FAA's direction, three Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Airside Project's technical consulting team and other independent industry experts. The other projects cited in this comment are not related to the Airside Improvements Project. Any impacts associated with those projects will be addressed in individual project filings, if required under NEPA and/or MEPA and also in the ESPR (formerly GEIR) process. The ongoing state ESPR process provides information to the federal and state agencies and the general public on the environmental effects of existing and future operations at Logan Airport, on the cumulative effect of airport operations, and on the planning context for individual projects at Logan Airport. The GEIR/ESPR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR as a background document."

Code	Topic 1	Topic 2	Comment	Response
207.5	Analysis Assumptions/ Methodologies	Studies	Massport's impacts analysis understates impacts in a number of ways that have the cumulative effect of systematically minimizing Logan's impacts on the surrounding communities: • failure to account for the context and intensity of growth in airport operations, both land and air • unreliable modeling of impacts • inadequate and inaccurate monitoring of impacts and of mitigation • failure to report or take into account community feedback • persistent use of data known to be flawed, and unwillingness to correct mistakes • systematic and knowing selection of data so as to minimize the appearance of impacts.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's ESPR (formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan." The emission inventory results show that the Airside Project, including the Centerfield Taxiway, would lead to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. The small changes in emission concentrations at Bayswater Street, East Boston, and Winthrop will meet federal standards for hydrocarbon emissions. Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings.

Code	Topic 1	Topic 2	Comment	Response
207.6	Noise	Stage 3 Aircraft	...Stage 3 aircraft are not appreciably quieter on landing and take-off, the noisiest operations which are the ones that affect the surrounding communities. Contrary to Massport's disingenuous assertions, Stage 3 aircraft do not and cannot reduce the noise exposure of the surrounding communities,....	Manufactured Stage 3 airplanes are definitely quieter during both takeoff and landing than are old Stage 2 airplanes that have been hushkitted to meet Stage 3 noise limits. Massport agrees that as long as hushkitted aircraft remain in the fleet, they will be perceived as the primary cause of noise.
207.7	Noise	PRAS	...the use of outdated PRAS goals to justify impacts as "community-approved". ...is misleading in the extreme.	The PRAS goals were established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. As demonstrated in the Supplemental DEIS/FEIR, there have been no significant demographic changes since the time of the establishment of the PRAS goals. An update of the PRAS goals is therefore not warranted. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.
207.8	Noise	Model	...Massport INM noise modeling has fallen short of actual impacts in several instances.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.

Code	Topic 1	Topic 2	Comment	Response
207.9	Noise	Model	Massport does not include in its proposal the persistent community protests, the noise complaint data from its hotline, or present in a coherent way its own track record of inaccurate noise measurement. Even protests from local, state and federal representatives are not used as a check for the numbers that Massport wants to use....	Massport reports noise complaints annually in its ESPR (formerly GEIR) and each Annual Update. This is published and distributed widely and presented to the Massachusetts Secretary of Environmental Affairs who reviews the documents under MEPA requirements. Letters and comments specific to this project and the responses to those comments are published in Volumes 5-10 of this Supplemental DEIS/FEIR.
207.10	Noise	Model	...the waterfront area, including Beacon Street, is not on the map under the 14/32 proposal...This is so, even though Massport uses numbers of several thousands of people in Chelsea in the 65dB, up to the 75dB range, in its hypothetical 1993 baseline for the city.	Refer to the updated graphics in Chapters 4, 5 and 6 of this Supplemental DEIS/FEIR. Graphics have been updated, supplemented and corrected.
207.11	Analysis Assumptions/ Methodologies	Studies	There are still more sources of bad statistics and understatement. One is the omission of significant data through failure to coordinate with other agencies with necessary expertise, such as the Department of Public Health, the State Transportation Department., including public transportation gurus and highway departments, or through failure to report available information.	The model and methods used to develop these data were based on EPA- and DEP-approved guidelines and show that the NAAQS will not be violated.
207.12	Air Quality	Monitoring	The 1 air monitor in Chelsea from Department of Public Health is at Soldier's Home, as far away as you can get from the air and ground traffic to the airport. There's a concentrated impact area [around truck routes]. It's not monitored. These impacts are not accounted for in the proposal, and they will only get worse if Logan's operations are allowed to increase.	The DEP monitor at Soldier's Home is the closest station to Logan Airport that measures ozone. The closest DEP monitoring site to Logan Airport is at Bremen Street. Several pollutants are monitored at this site: CO, NO_2, SO_2, and PM_{10}. Background concentrations were obtained primarily from the Bremen Street site. Massport also has several NO_2 monitoring stations in the Chelsea area.
207.13	Public Health	Effects	...Massport ...[should fund a DPH] epidemiology study...of health impacts in the surrounding communities.	Public health issues are discussed in Section 6.8 of the Supplemental DEIS/FEIR. Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.*
207.14	Noise	Soundproofing	Massport does not reflect these complaints [regarding soundproofing] in its analysis of mitigation. The complaints mean that even where Massport has tired to mitigate its impacts, it hasn't been able to. Nor does Massport identify any measures to assess whether the soundproofing works.....	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.

Code	Topic 1	Topic 2	Comment	Response
207.15	Noise	Model	Massport has underestimated the number of people who live with 60dB, 70 dB, 80-past 100dB routinely; the air and noise pollution its total operations produce; the social, economic, health and esthetic damage it does. By not verifying its models, and failing to take into account information from residents, Massport has submitted an impacts analysis that is statistical nonsense.	Tables 6.2-4 and 6.2-5 show the noise exposed population for the 29M Low and 37.5M High Fleet scenarios respectively. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).*

Code	Topic 1	Topic 2	Comment	Response
207.16	Environmental Review Process	FAA/NEPA, MEPA	...Massport ...[has failed] to propose meaningful, reasonable alternatives and to conduct a thorough study and detailed description of them...To allow Massport to conduct this analysis without proposing a significant alternative to the growth of the airport is to make a mockery of NEPA.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
207.17	Alternatives	Preferred Alternatives	Whatever Massport thinks the capacity should be, community residents from at least 28 cities and towns have been vociferous in their many meetings with Massport and the FAA, in their noise complaints, and through their local, state and federal representatives, that the human carrying capacity in this area has been exceeded-a critical point left out of Massport's analysis.	Comment noted.
207.18	Alternatives	Other Non-Construction alternatives	The environmental secretaries directed Massport to explore ways of accomplishing its goals without airfield improvements...and to consider operations restrictions as a mitigation measure...These directives are ignored or minimized in the alternatives analysis.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
207.19	Alternatives	Other Non-Construction Alternatives	A meaningful alternative that would accommodate travelers and communities would be to reassess the effective capacity of Logan with the goal of shifting traffic now, and creating a well-functioning, right-size airport in the context of livable communities...Airport capacities have been modified, and there is no reason those modification cannot be downward, in line with public health and safety; business pressure and the convenience of the traveling public have to be secondary concerns to safety and health.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of the Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
207.20	Alternatives	Reduced Approach Minima	Along the flight paths, planes fly over a major power plant, an LNG facility, several oil tank farms, the Tobin Bridge and 2 other bridges that are major thoroughfares into East Boston and downtown Boston, and hills. Whatever safety advantages there are to flying on IFR are cancelled out by the increased risks of flying over this terrain without a visual check.	The primary benefit of Runway 14/32 is to reduce delays during VFR conditions when strong northwesterly winds current limit Logan Airport to a single arrival stream. During IFR conditions, landings on Runway 32 would be limited by obstacle clearance—ship masts in the harbor and buildings in Boston. No approach lighting pier is planned for Runway 32 since it could not improve the landing minimums below 400 to 500 feet. Moreover, under IFR conditions the capacity of the Runway 33L/32/27 configuration would be compromised by the need for diverging missed approach and departure paths and the crossing of both Runway 32 and Runway 33L by Runway 27 departures.
207.21	Alternatives	Reduced Approach Minima	The lack of awareness and respect for the surrounding communities that ...[reduced minimums] reflects is symptomatic of the myopia of Logan's planning. I urge the FAA to withdraw this proposal or the reviewing agencies to reject it as inadequate in its analysis.	The agreement between the City of Boston, the FAA and Massport stipulates that any modification of the existing minimums requires completion of an EIS/EIR, even though the setting of minimums is otherwise categorically excluded from the EIS/EIR process. The reduced minimums will, in fact, enhance safety by providing precision guidance to a point closer to touchdown and reducing reliance on Runway 4R under poor weather conditions, when winds may favor use of an alternate runway.
207.22	Environmental Justice	Impacts	Massport's Environmental Justice (EJ) analysis is also flawed. Both within the specific poverty and race guidelines of the Presidential Order, and a broader analysis based on the principle of proportionality, Massport's proposal fails the test of environmental justice.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
207.23	Environmental Justice	Impacts	Because...analysis is based on noise contour maps, its numbers are understated and unreliable. It is impossible to know from its analysis how many people who are minorities or below the poverty line (BPL) are disproportionately affected by its operations.	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively
207.24	Environmental Justice	Demographic Data	There is another EJ issue that Massport fails to acknowledge. The principle of EJ is based on the notion of proportionality and the reality that certain populations are disproportionately affected by polluting activities.	The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Refer to Section 6.2 and Section 6.8 of the Supplemental DEIS/FEIR, respectively, for additional information on noise impacts and environmental justice.
207.25	Public Health	Effects	Massport and the FAA are "committed" to maximizing the use of the runways that currently blitz Chelsea: 15R/33L, for late night flights in particular, between midnite [sic] and 6 a.m. ...and to run the greatest number of additional flights: 22,000, overhead. To allow Logan to expand its operations, air and ground, through communities like Chelsea, is unconscionable. In environmental terms, it is to institutionalize a sacrifice area. No community should have to endure this.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
207.26	Cumulative impacts	Delay	The root problem is that, even operating at an annual average over all conditions of 115 operations per hour, Logan is operating beyond its effective capacity. For some time, it has been operating well beyond the carrying capacity of the communities whose residents eat its impacts.	Comment noted.
207.27	Environmental Review Process	Public Process	Among the information and initiatives that are needed are: coordination and funding of agencies to provide data on air and noise pollution and epidemiology such as the Department of Public Health and the state transportation department, especially the regional and highway departments; adequate and accurate monitoring of air and noise pollution in areas that reflect those impacts; consideration of improvements such as a ban on night flights and rerouting of passenger and truck traffic away form residential areas; a collaborative process that gives the communities a real influence over airport operations that affect them, and that reflects real alternatives to Logan growth as part of a regional transportation policy; and ways to ensure that there is an independent, competent assessment of Logan's impacts.	Public health issues are discussed in Section 6.8 of the Supplemental DEIS/FEIR. Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.*

LETTER 208

April 19, 1999

Massachusetts Environmental Protection Agency
Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202

Mr Durand:

I would like to take this opportunity to point out that the Draft EIS/EIR for runway 14/32 and the Centerfield Taxiway is inadequate and request that it be judged so for the following reasons:

1. Outdated studies and figures (potentially misleading) were used by Massport
2. FAA modeling guidelines were not adhered to by Massport
3. There were a lack of alternative studies in the report, such as:
   Better use of regional airports such as Hanscom, et al
   Study for a Second Airport
   Regional Rail Transportation Planning

208.1

As a resident of the greater Boston community, I ask that you consider social justice and fairness as related to the environmental effects in the short and long term of this proposal for the good of all residents and visitors. 208.2

Logan Airport is the only inner-city airport, that is looking to expand, without a sister regional option for overload & future capacity; the regional area is the only one that I know of in this country without a second major airport and a regional plan. As a frequent traveler I expect that when I travel I will have a commute in the range of one hour when I am traveling from the airport to the downtown of a major city, I belive that travelers will still come to Boston if they have a fourty minute drive to/from the Worcester area. Why should we continue to support this antiquated airport location at the expense of our overall environment, taxing our communities and infrastructure only to see a future with limitations at Logan Airport? 208.3

With it's unique and challenging location, Logan Airport should be utilized to its fullest extent with the current configuration; future growth and delay scenarios should be resolved through a regionalized planning effort. All that are affected should have proper time to review the facts and be given a chance to vote on this matter. 208.4

Massport is a public agency, as a member of the public we are all "stockholders" in this corporation. Let it be a matter of public record that this "stockholder" believes that Massport has not followed the rules, will not follow the rules and is acting in it's own interest, not the interest in which it serves

If you have any questions, please feel free to call me at 617-889-1400.

Thank you for your consideration,

Ron D. Morgese
65 Breakwater Drive
Chelsea, Ma 02150

208.1	Environmental Review Process	FAA/NEPA, MEPA	... Draft EIS/EIR for Runway 14/32 and the Centerfield Taxiway is inadequate and request that it be judged so for the following reasons: 1. Outdated studies and figures (potentially misleading) were used by Massport 2. FAA modeling guidelines were not adhered to by Massport 3. There were a lack of alternative studies in the report, such as: better use of regional airports such as Hanscom, et. al; Study for a Second Airport; Regional Rail Transportation Planning	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. Consistent with the request made by the EOEA in its Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. The High and Low Fleet scenarios for 37.5 and 45 million passengers represent a range of possible future activity—both levels and fleet mix—at Logan Airport. So-called New Large Aircraft (NLA) carrying up to 1,000 passengers are still just in the discussion phase. No manufacturer has undertaken serious development of such aircraft yet, which would be a multi-year process. These aircraft would probably require modifications to existing airport jetways and apron areas along with increases in taxiway width and turning area. Their use would be limited to extremely high-density markets, and it is not likely that Boston would be among these. In fact, the number of "jumbo jets" serving Logan Airport has declined in recent years. Consequently, the NLA was not included in the Future Fleet scenarios. DELAYSIM is a unique model that simulates how Air Traffic Control uses an airport's runways over time based on actual weather patterns and expected demand conditions. The FAA does not have an equivalent model, but uses a simplified (and less precise) procedure of weighting delays based on percentage of time different weather conditions exist. As part of the Airside EIS/EIR process, Massport explored several regional alternatives to determine the extent to which passenger diversion to other airports and travel modes or the elimination of demand through advances in telecommunications technology can solve Logan Airport's current and future delay problems. These alternatives have potential to absorb a portion of the growing demand for Logan Airport air services, but they will not provide sufficient relief to eliminate the need for airside projects. Chapter 2 of the Supplemental DEIS/FEIR includes a complete discussion of the regional transportation planning context.

Code	Topic 1	Topic 2	Comment	Response
208.2	Environmental Justice	Impacts	...I ask that you consider social justice and fairness as related to the environmental effects in the short and long term of this proposal for the good of all residents and visitors.	The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Refer to Section 6.2 and Section 6.8 of the Supplemental DEIS/FEIR, respectively, for additional information on noise impacts and environmental justice.
208.3	Purpose and Need	Airfield Capacity	... Why should we continue to support this antiquated airport location at the expense of our overall environment, taxing our communities and infrastructure only to see a future with limitations at Logan Airport?	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions.
208.4	Regional Transportation	Regional Airports	...future growth and delay scenarios should be resolved through a regionalized planning effort.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 209

Material here was first printed as a letter to the editor in the Chelsea Record

Has Peter Blute told three lies?

Peter Blute has told the public and the politicians several things about runway 14/32.

At least three of them seem to be lies.

<bold>Only a new runway will be able to take care of the increasing delays at Logan airport:

>ld>

The FAA lists the delay per 1000 operations at Logan on its web pages under Airport Data.

In 1992 the delay rate was less than four percent (3.923%).

By 1996 the delay rate was about two and one half percent (2.519%). Peter Blute is new to his job.

A reasonable question would be ...

What did Peter Blute do that made the delay rate go back up after 1996 ?? 209.1

Another would be ... Why has he not given the 97, and 98 rates to the FAA for posting on Its web site?? 209.2

Another would be ... Why are we worried about a delay rate less than 4%?? 209.3

the fact that Massport did not use established FAA methods of determining delays is proof of a disregard for the

truth and the general public.

<bold>The new runway will be uni-directional:

</bold>

The FAA web site states that the plan is to construct a new runway 32

<bold>AND</bold> to extend runways 15r/33l and runway 9.

There are three runways involved.

And the FAA would have the final say about directions for takeoff and landing.

A reasonable question would be ... How can Peter Blute promise something that he can not lawfully deliver? 209.4

Before construction can begin something must be done about the migratory birds that nest at Logan.

An article in the Herald disclosed that Massport is prepared to spend a quarter of a million dollars to move the birds from Logan to Otis Air Force Base. 209.5

<bold>Massport claimed it had the cooperation of the Mass Audubon Society for this move.

</bold>

A spokesperson at the office of Mass Audubon disclaimed any such agreement.

A reasonable question would be ... How can the public trust anything that Massport says?

for this, and any number of reasons as contained in the Draft Environmental Impact Analysis by:

Peter Alachi, MS, Biology

<bold>the Draft by Massport must be rejected out of hand!!!</bold>

Code	Topic 1	Topic 2	Comment	Response
209.1	Purpose and Need	Delay	...What did...[Massport] do that made the delay rate go back up after 1996?	Refer to Section 1.4 and Appendix C of this Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
209.2	Purpose and Need	Delay	...Why has ...[Massport] not given the 97, and 98 [delay] rates to the FAA for posting on its website?	The FAA delay statistics on the FAA web site are collected by the FAA and not by Massport. Refer to Section 1.4 and Appendix C of the Supplemental DEIS/FEIR for a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.
209.3	Purpose and Need	Delay	...Why are we worried about a delay rate less than 4%?	Refer to response to Comment 209.1.
209.4	Alternatives	Runway 14/32	...How can ...[Massport] promise [to control the directions of takeoffs and landings]?	The Runway 14/32 concept under review in this Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
209.5	Ecosystems	Rare Species	Before construction can begin something must be done about the migratory birds that nest at Logan. An article in the Herald disclosed that Massport is prepared to spend a quarter of a million dollars to move the birds from Logan to Otis Air Force Base. Massport claimed it had the cooperation of the Mass Audubon Society for this move. A spokesperson at Mass Audubon disclaimed any such agreement.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.

LETTER 210

On 4/20/99 the Boston Herald Reported complaints of Airline passengers.
Airport delays were not on the list.
Passengers complain about the way they are treated by the Airline.

Massports delay statistics are not the point for airline travelers.

1. Massport claims that last year there were over 120,000 hours of delay at Logan.
2. There are less than 9000 hours of real time in a year.
3. It is obvious that they are counting delays more than once.
4. This is not the accepted method of delay counting according to the Federal Aviation Agency.
5. Since Massport has lied with statistics in its EIS Draft the draft must be rejected out of hand.

210.1

Letter 210

Code	Topic 1	Topic 2	Comment	Response
210.1	Delay	Model	1. Massport claims that last year there were over 120,000 hours of delay at Logan. 2. There are less than 9,000 hours of real time in a year. 3. It is obvious that they are counting delays more than once. 4. This is not the accepted method of delay counting according to the Federal Aviation Agency. 5. Since Massport has lied with statistics in its EIS Draft, the Draft must be rejected out of hand.	The results for 1998 presented in the Airside Project Draft EIS/EIR were based on preliminary data. The Supplemental DEIS/FEIR contains updated information for 1998, including total annual runway delays of 129,500 hours. These are cumulative delays for all 513,800 flights, or an average of 15.1 minutes per flight. The Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays, including a description of FAA and DOT delay measures and their limitations. Estimated delay reduction is one of the primary factors used by the FAA for approving aviation investment projects.

40 Beacon Street
Chelsea, MA 02150
LETTER 211
April 21, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley-EOAO No. 10458
100 Cambridge Street
Boston, MA 02202

Dear Mr Pugsley:

This was a video taped by a local resident,Elaine McGrath of Beacon St.,Chelsea, to demonstrate to local officials some of the crippling effects of truck traffic leaving the Tobin Bridge, exiting on to narrow Chelsea streets because they are considered Truck Routes by Mass Highway. This video was shown on Chelsea Community Cable April 1998 and also filmed that month. (April is a'slow' truck traffic time since few dump trucks going to the salt pile and fewer heating fuel trucks going to the many tanks in Chelsea, but the Air Cargo trucks know no slow season.) It waw purposely filmed when planes weren/t over head because they are the only noise that is capable of drowning out the Air Cargo truck noise, but a few planes directly overhead do slip in halfway through the film. As a result of tremendous effort by our City Councilors and local residents, there may be a late night ban on truck traffic on some of these roads, but we have been told that trucks will always use this ramp because it is a route to the Airport.

Vol.1,ES-27: "Truck traffic associated with the desired airside improvements...average about 129 round-trip truck trips daily. Trucks will be prohibited from using local streets and thus will not impact local residential streets in communities surrounding the airport. Construction vehicles will be required to use state highways and/or main airport roadways which are designated truck routes."

a) Massport needs to let us know how 129 ("average,about") truck trips was chosen. As you may know from recent hearings/readings Massport has difficulty using accurate numbers for what has already occured, let alone giving us a number as a projection. Massport is not good in giving an accurate accounting. Their truck numbers are a very important issue to us. In the EIS 58 to 500+/day truck trips are projected,which is it? Is is in addition to? 211.1

b) Many streets in surrounding airport communities are designated truck routes, done years ago by major state agencies, Iwould hazard a guess, working together on occasion to speed up truck traffic to the Airport. I have seen how many years it takes to even limit a few trucks for a few hours on one of these streets. (The cost of residents hours working to limit Logan's impacts on their lives is also not given in the EIS,nor considered a problem by the writers of the EIS)

c) Construction vehicles will be using the roads seen in this film which Massport uses presently for their airport traffic, air cargo, and Big Dig dump trucks (Massport told us no Big Dig trucks on this route, the drivers drinking coffee in 'Christies' told us otherwise...we just thought someone was digging a very bid garden out in Boston)
Chelsea will be the city for Logan's trucks, traffic, noise and air pollution, dented cars, accidents.

"vehicles will be required..." By Whom? Who has this authority or a desire to use it? Who will enforce it? Massport Police? Local police; shortstaffed, overworked-out there stopping trucks? Who? Who will keep these trucks out of residential neighborhoods? (which the neighborhood on the film is so called residential/commercial)

So here's the popcorn, sit back and watch-this is Chelsea Waterfront not at its best but getting there-brick rowhouses built 1860's, formally filled with seafaring folk now populated with a diverse population of many color, creeds, age, land of origin-you name it and we've got it-and it works! But unfortunately, it is not mentioned in the EIS when it faces the Environmental Justice analysis because Chelsea was taken off the Noise Contour Map because of inaccurate monitoring (noted in many reports on your desk I'm sure) by Massport.
Chelsea should be a hotbed of Environmental Justice concerns and it is being addressed with the many other polluting businesses in Chelsea but we can't get Chelsea's minorities and low-income earners even in the EIS. Why?

Thank you for your time and hard work on this issue-it's really life and death to us here in these towns-we don't want to become a ghost town,polluted unliveable so that Massport can take more land for its parking lots and air cargo hangers.

Respectfully,

Mary Jane Quinn

Letter 211
Mary Jane Quinn
Private Citizens: Chelsea

Code	Topic 1	Topic 2	Comment	Response
211.1	Ground Transportation	Access to Logan	Massport needs to let us know how 129 ("average, about") truck trips was chosen....Their truck numbers are a very important issue to us. In the EIS, 58 to 500+/day truck trips are projected. Which is it? Is it in addition to?	The number of round trip truck trips associated with construction of the Preferred Alternative as presented in the Airside Project Draft EIS/EIR ranged from a high of 324 per day to a low of 49 per day, with 129 representing the average number of daily truck trips associated with construction of the Airside Preferred Alternative. The cumulative number of truck trips for all concurrent on-airport construction projects ranged from a high of 580 to a low of eight per day. The Airside truck trips were included within the cumulative number. Construction traffic associated with the airside improvements has now been significantly reduced from the numbers presented in the Airside Project Draft EIS/EIR as a result of the reduction of soil material to be removed off-site. See Sections 6.9 and 7.5 of the Supplemental DESI/FEIR for additional discussion of construction impacts.

LETTER 212

40 Beacon Street
Chelsea, MA 02150
April 20,1999

Secretary of Environmental Affairs
attention MEPA Office
Mr. Arthur Pugsley-EOEA No.10458
100 Cambridge Street
Boston, MA 02202

Dear Mr. Pugsley:

I've enjoyed living in the Chelsea Waterfront neighborhood for the last 9 years and I can only speak to the stunning inadequacies and blatant omissions of data versus the reality found in Chelsea. On any page of the EIS where there is a reference to noise, air, odor pollution; air cargo truck traffic; Environmental Justice or 'mitigation' I know its data collection is flawed or tragically non-existent concerning Chelsea. Of course, then, any 'conclusions' or projections drawn from such poor 'info' gathering and reporting would have to be considered flawed or inadequate because what you had been given to work with was such. The EPA's best and most carefully drawn conclusions would have to be considered pointless, since you have not been given what MEPA had requested of Massport- an accurate, thoughtful, thorough accounting of present impacts of Logan and its operations and a complete picture of environmental impacts of any proposal. 212.1 212.2

A few examples:
Vol. 1, ES-5: "...14/32 will provide an opportunity to reduce the most severely moise impacted population..."

Chelsea is severely impacted by jet noise (see photos). Massport will not admit this on paper (ex:"0 noise impacted population" GEIR)--so if they won't acknowledge it--they don't have to reduce it! Massport can't tell you what the noise level is in Chelsea because they have chosen not to find out: 212.3

1. Chelsea was taken out of the Noise Contour Map and yet our noise has not abated esp. considering that flight operations have doubled in that time. Massport officials told residents and Chelsea City Councillors that we probably do have enough jet moise to be in but they wouldn't file this info with FAA till their normal filing time 5 yrs later.(this conveniently brings it to after this EIS filing process) 212.4

2. The Noise Monitor on Admiral's Hill was broken for 2 YEARS, without mention, without repair, without apology, without correction to the data..."0" noise recorded, documented and tabulated as such. Reported only when residents asked specifically and repeatedly for this data.

3. In 1998, Chelsea City Councillor Preston Galarneau fought to get a noise monitor on his Beacon St home-1 monitor delivered=broken...2cd monitor delivered= broken...BUT even with 'non-functioning monitor' days tabulated in for those few weeks-the numbers reportedly averaged ≥ 70dB with peaks of 100dB or greater! So if Massport's data is so completely untrustworthy,how can they decide how much more noise to give us(to be "equitable") if they don't know what we have now? THEIR COLLECTION OF DATA IS INADEQUATE, THEIR MONITORING APPEARS MANIPULATED and they have the nerve to send it to the EPA with conclusions drawn from it and proposals based on it. 212.5

4. Now we are discovering that Massport benefits from the use of this flawed, manipulated data. Chelsea has one of the highest immigrant, minority and low income population in the state-7 languages 'officially' used in the public schools, many more spoken--BUT Chelsea was taken off the Conour Map, Massport 212.6

refused to collect or consider reliable data to let us back onto Map, and so Chelsea's minority and low income population doesn't have to be included statistically by Massport in their Environmental Justice analysis which was required for this EIS. Again, how convenient.

Vol.1, ES-20: "Noise modeling analysis was conducted for all alternatives... noise contours and noise exposed populations were determined using the Integrated Model version 5.0" (Sounds good...but see above.\.I don't care who's 'modeling' ...the machines are broken.) How can the public, the EPA, the courts have faith in Massport's modeling if they can't or won't gather basic info properly. 212.7

Vol.1, ES-28: "Therefore there are no cumulative air quality or odor impacts associated with the Airside Project."

The one air quality monitor is on the highest hill in Chelsea and not under a flight path, nor near a jet at take-off or landing! On March 3,1998 a Massport official stated jets were "about 260 ft off the ground" in my neighborhood. Massport has been told by residents for years that on take-off and landings at this level we see emissions spewing from the jets. Massport told us that what we see is "harmless, it's been tested" or "you don't see anything, nothing comes out". 212.8 We would like to see a study included in an EIS reporting what is raining down on us and at such close quarters. We would like it examined thoroghly, but perhaps not by Massport (can you blame us?).

SINCE THERE IS NO AIR QUALITY MONITOR IN THE WATERFRONT NEIGHBORHOOD,WHERE THE PLANES ARE, MASSPORT CAN TELL US THERE IS NO AIR QUALITY PROBLEM. Their conclusion... Chelsea waterfront neighborhood can handle an additional 23,000 large jets (1 every 10 min,10 hrs/day,7days/wk-additional) at less than 300' ...why?...Because we have no noise or air pollution that THEY can find.

The EIS has a 'dollar value' for the flight delays. I would like to see several mature statistical analysis showing how such a figure was derived. I would also 212.9 like to see an unbiased, detailed reporting of what exactly was the cause of each delay. With the knowledge perhaps a new, varied, less harmful, truly helpful or even cost effective alternatives may be readily apparent.

Why isn't there an economic breakdown for the citizens of the dozens of communities affected by Logan and its operations and traffic. What is the 'dollar value' lost for OUR DELAYS in Airport traffic-every day (no matter what the wind direction!)

Our health cost/missed work or school days

Our sleep loss resulting in decreased lifespan,decreased work and school performance...jets stop about midnite,then cargo planes throghout the nite,then jets at 6:15AM) 212.10

Our cost of buying(and running 24hrs/day) an air conditioner

Our car insurance(Logan Rental cars accidents charged to boston,Revere,Chelsea) (All 3 Tunnel accidents charged to Boston,no matter where car is based)

Damage to Our roads (causing Our flat tires,ruining Our car's suspension system)

Our own 'soundproofing' which we've paid

Our cracked walls and shattered windows etc etc etc

Why does Massport just get to put THEIR 'dollar value' on THEIR'troubles',but not ours?

MASSPORT APPEARS TO PLAY WITH THE NUMBERS,BUT ON THESE EXAMPLES, THEY DIDN'T EVEN BOTHER TO COLLECT THE NUMBERS!

There may be other ways to improve Logan's efficiency, other ways to improve regional transportation without greatly damaging lives and the environment. 212.11 But we do not know from the material Massport has chosen to collect or not collect, chose to give you or not give you.

Please help us. Logan is filled to its natural capacity now-it's stuffed but can't seem to admit it. The residents know what squeezed-in Logan and its far-flung operations do to our lives, our sanity,our towns, our children, our days and nights,our air, land and water.

We've told Logan...but they did not tell you.

Thank you very much for your time, efforts and attention.

Respectfully,

Mary Jane Quinn

Code	Topic 1	Topic 2	Comment	Response
212.1	Environmental Review Process	Impacts	...On any page of the EIS where this is a reference to noise, air, odor pollution; air cargo truck traffic; Environmental Justice or 'mitigation,' I know its data collection is flawed or tragically non-existent concerning Chelsea. Of course, then, any 'conclusions' or projections drawn from such poor 'info' gathering and reporting would have to be considered flawed or inadequate because what you had been given to work with was such.	Noise was identified as the only off-airport impact associated with the Preferred Alternative (refer to Section 6.2 of the Supplemental DEIS/FEIR for a discussion on noise impacts). Environmental and health studies relating to the City of Chelsea were reviewed to assess the potential for other cumulative or multiple adverse exposures, since the increase in population within the 65 dB DNL contour associated with the Preferred Alternative is primarily within this community. A review of issues within Chelsea indicated a concern regarding toxic discharges associated with industrial facilities, truck emissions, and contamination of Chelsea Creek. There was nothing to suggest that these issues increased the noise impacts associated with the Preferred Alternative. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. Refer to Section 6.8 of the Supplemental DEIS/FEIR for additional information. The dispersion model portion of the LDMS is an EPA-approved model. The methodology is consistent with FAA and EPA guidelines.
212.2	Environmental Review Process	MEPA	...you have not been given what MEPA had requested of Massport—an accurate, thoughtful, thorough accounting of present impacts of Logan and its operations and a complete picture of environmental impacts of any proposal.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
212.3	Noise	Impacts	Chelsea is severely impacted by jet noise (see photos). Massport will not admit this on paper (ex: "0 noise impacted population" GEIR)—so if they won't acknowledge it—they don't have to reduce it! Massport can't tell you what the noise level is in Chelsea because they have chosen not to find out:	Tables 6.2-4 and 6.2-5 show the noise exposed population for Chelsea for the 29M Low and 37.5M High Fleet scenarios, respectively. Although both show no noise exposed population in DNL 70 dB and above, both show noise exposed population in the DNL 65 dB and DNL 60 dB and above categories.
212.4	Noise	Impacts	Chelsea was taken out of the Noise Contour Map and yet our noise has not abated, esp. considering that flight operations have doubled in that time. Massport officials told residents and Chelsea City Councillors that we probably do have enough jet noise to be in but they wouldn't file this info with FAA till their normal filing time 5 years later. (This conveniently brings it to after this EIS filing process.)	Chelsea appears on the basemaps showing the noise contours for each of the fleets and alternatives studied. The community is exposed to noise either from 60 to 65 dB or from 65 to 70 dB, depending on the fleet and alternative being evaluated. Chelsea is also listed as a separate community in the tables of population counts by increment of exposure (Tables 6.2-4 through 6.2-7 and 6.2-20 and 6.2-21).
212.5	Noise	Impacts	...how can they decide how much more noise to give us (to be "equitable") if they don't know what we have now? THEIR COLLECTION OF DATA IS INADEQUATE, THEIR MONITORING APPEARS MANIPULATED and they have the nerve to send it to the EPA with conclusions drawn from it and proposals based on it.	Comment noted. The EPA will draw its own conclusions regarding the efficacy of the data and findings presented here.

Code	Topic 1	Topic 2	Comment	Response
212.6	Environmental Justice	Impacts	Now we are discovering that Massport benefits from the use of this flawed, manipulated data. Chelsea has one of the highest immigrant, minority and low income population in the state—7 languages 'officially' used in the public schools, many more spoken—BUT Chelsea was taken off the Contour Map...	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
212.7	Noise	Impacts	Vol. 1, ES-20: "Noise modeling analysis was conducted for all alternatives... noise contours and noise-exposed populations were determined using the Integrated Model version 5.0." (Sounds good...but see above...I don't care who's 'modeling'...the machines are broken.) How can the public, the EPA, the courts have faith in Massport's modeling if they can't or won't gather basic info properly.	Comment noted. The EPA will draw its own conclusions regarding the efficacy of the data and findings presented here.
212.8	Air Quality	Impacts	...Massport has been told by residents for years that on takeoff and landings at this level [260 ft.] we see emissions spewing from the jets. Massport told us that what we see is "harmless, it's been tested" or "you don't see anything, nothing comes out." We would like to see a study included in an EIS reporting what is raining down on us and at such close quarters. We would like it examined thoroughly, but perhaps not by Massport (can you blame us?).	In 1997, Massport conducted a Soot Deposition Study at Logan Airport and the surrounding communities. The results of this study did not identify any discernable differences in samples collected on, or in the vicinity of, the airport compared to samples collected away from the airport. DEP also maintains a permanent air monitoring station (the "Bremen Street" station) in close proximity to Logan Airport. Data collected at this station has continually shown that the air quality meets the NAAQS.

Code	Topic 1	Topic 2	Comment	Response
212.9	Delay	Model	The EIS has a 'dollar value' for the flight delays. I would like to see several mature statistical analyses showing how such a figure was derived. I would also like to see an unbiased, detailed reporting of what exactly was the cause of each delay. ...	The cost of delay analysis presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is based on a methodology recommended by the FAA. The cost of delay to a passenger ($27 per hour) is a weighted average cost for business and leisure passengers. Refer to FAA APO Bulletin APO-97-1. Chapters 1 and 4 of the Supplemental DEIS/FEIR provide analysis of delays at Logan. Delays primarily occur when wind or weather conditions require the use of configurations with fewer than three active runways or when poor weather requires increased separation distances between aircraft. Proposed Runway 14/32 would be designed to reduce delays at Logan Airport from adverse winds Refer to Section 1.4 and Appendix C of the Supplemental DEIS/FEIR contains a description of the delay factors at Logan Airport, and a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.
212.10	Environmental Justice	Impacts	Why isn't there an economic breakdown for the citizens of the dozens of communities affected by Logan and its operations and traffic? What is the 'dollar value' lost for OUR DELAYS on airport traffic—every day (no matter what the wind direction!) • health cost/missed work or school days, • sleep loss resulting in decreased lifespan, decreased work and school performance, • cost of buying (and running 24 hrs/day) an air conditioner • damage to our roads • our own 'soundproofing' which we've paid • our cracked walls and shattered windows, etc. Why does Massport just get to put THEIR 'dollar value' on THEIR 'troubles,' but not ours?	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
212.11	Alternatives	Other Non-construction Alternatives	There may be other ways to improve Logan's efficiency, other ways to improve regional transportation without greatly damaging lives and the environment. But we do not know from the material Massport has chosen to collect or not collect, chose to give you or not give you.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
212.12	Noise	Model	Table 6-3, Noise-Exposed Population by Community [in Logan GEIR]...averaged [noise] over 24 hrs and 7 day/week. Not per exposure. [There are still]...many planes with >65 Ldn over Chelsea...[These are] creative statistics. Must have independent study [by an] independent group giving ...[Massport] data so that ...[Massport] may make an informed decision.	Table 6-3 in the Logan Airport 1994/1995 GEIR is similar to that in Tables 6.2.4 and 6.2.5 in the Supplemental DEIS/FEIR. The Supplemental DEIS/FEIR also gives values of the maximum sound levels at 23 sites in Table 6.2.8 of the Supplemental DEIS/FEIR and the time-above threshold at those sites in Table 6.2.13 of the Supplemental DEIS/FEIR. Additional data can be found in the Appendix E of the Supplemental DEIS/FEIR. The Supplemental DEIS/FEIR uses the DNL as the primary descriptor of aircraft noise exposure in the community. This metric was developed by the United States EPA for this purpose and was found by the EPA to correlate better with the effects of noise on humans than any other descriptor. The methodology used is in the Supplemental DEIS/FEIR is in accordance with all applicable federal guidelines and is the same methodology that would be required for a noise study performed by any other independent firm.

LETTER 213

[redacted]

RECEIVED
APR 6 1999
MEPA

From my front step, Chelsea Waterfront — but Massport states "Zero noise impacts on Chelsea." Their faulty conclusion - from faulty DATA - from

7-4-99

broken noise monitor Admiral's Hill for 2 yrs — it read 0 w/ planes like this — they wrote "0" — they sent "0" to FAA — they knew monitor broken — they used that 'data' — they sent it to FAA & EPA and yet we have to read in Sun Globe 4/4/99 Jeremy Crockford, massport spokesman, said 'This is the triumph of statistical nonsense over common sense!' (the refering to CAG 'delay' report) Hello ?!!!

Massport, at least - at the minimum gives EPA faulty info & asks them to make a ruling on it alone - knowing they (EPA) don't have the budget to do their own investigation - and, could we say, at worst, they have knowingly chosen faulty info to send ?!!

Please consider other options — study before our towns are destroyed & emptied. Thank you for listening. MARY QUINN Chelsea MA

213.1	Noise	Impacts	[Massport's conclusion that there are] "zero noise impacts on Chelsea" [is based on] faulty data from [a] broken noise monitor [or] Admiral's Hill.	The noise monitoring site on Admiral's Hill played no part in analyzing noise from future alternatives with Future Fleet scenarios.

LETTER 214

EoEA #10458 Draft eir/eis.
Logan Airside improvement planning project
mepa unit - EoEa
Arthur Pugsley - 100 Cambridge ST 20 floor
Boston, Mass 02202

The eis/eir has been fairly well done. I support the use of the new runway described in the report. It will eliminate delays and ease some air ways problems. 214.1

However, the political aspect of this project has to be evaluated. Since the city of Boston is opposed, it will be difficult to complete the project and probably it won't happen.

If you develop Hanscom or Worcester airport as the second airport, how does one deal with transfers from major airlines to small planes that travel to Nantucket, Bangor, etc? It seems a massive new realignment of airline is necessary. I don't think Logan is ready for this 214.2

Another concern - More flights if possible should ascend or descend over the ocean before turning at higher altitudes west/south/and north. 214.3

Not mentioned in the report is the problem of fuel dropping in detail. Fuel does drop over cohasset when descending to Logan. My house is under the path, thus we join the other communities of the 214.4

negative effects and aspects of an urban airport. The best solution in time is moving the airport to a new area such as Hanscom and/or South Weymouth. Highway access could easily be achieved. There should have been a more in depth analysis of Hanscom and South Weymouth airports

214.5

Code	Topic 1	Topic 2	Comment	Response
214.1	General Support		The EIS/EIR has been fairly well done. I support the use of new runway described in the report. It will eliminate delays and ease some airways' problems.	Comment noted.
214.2	Regional Transportation	Regional Airports	If you develop Hanscom or Worcester Airport as the second airport, how does one deal with transfers from major airlines to small planes that travel to Nantucket, Bangor, etc.? ...	Commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field or Worcester Regional Airport, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights.
214.3	Alternatives	Operational Restrictions	...More flights, if possible, should ascend or descend over the ocean before turning at higher altitudes west, south and north.	The operations of Proposed Runway 14/32 would be over the water. The departures on Runway 14 would turn over the inner harbor and proceed out the harbor mouth, as do the departures on Runway 15R, the nighttime preferential runway. Similarly, the last several miles of the approach path to Runway 32 would be over water and largely uninhabited islands. When Runway 14/32 is in operation, it would reduce the noise exposure over populated communities.
214.4	Air Quality	Impacts	Not mentioned in the report is the problem of fuel dropping in detail. Fuel does drop over Cohasset when descending to Logan. My house is under the path, thus we join the other communities of the negative effects and aspects of an urban airport.	Fuel dumping (dropping) typically occurs only in aircraft emergencies. Air traffic control makes every effort to direct the pilot away from residential and other populated areas during this procedure. Notwithstanding the above, the Federal Aviation Administration (FAA) requirements allow fuel dumping at or above an altitude of 2,000 feet. This distance above ground allows much of the fuel to evaporate and disperse. Thus, emergency fuel dumping should have little or no impact on human health and welfare.
214.5	Regional Transportation	Regional Airports	The best solution in time is moving the airport to a new area such as Hanscom and/or South Weymouth. ...	Section 2.8 of the Supplemental DEIS/FEIR discusses passenger and activity growth at the regional airports and their effect on Logan Airport's projected passenger and activity levels. With regard to ridership projections on Amtrak's high-speed rail, the Airside Project Draft EIS/EIR described in detail the best current information. No updated projections are available. Refer to Appendix B for Amtrak's letter stating that no revised ridership estimates are available. Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport (as of January 15, 2000). Massport plays no role, however, in the decisions of private airlines regarding air service routes or service levels. As proprietor of Logan Airport, Massport's primary responsibility is to supply, operate, and maintain Logan Airport's infrastructure that includes the runways, taxiways, terminal buildings, parking facilities and access roads. As a recipient of federal airport grants, Massport must adhere to grant covenants that require it to operate Logan Airport in such a way so as to ensure access and availability for public use on fair and reasonable terms and without unjust discrimination.

123 Stoughton Street
Dorchester, MA 02125

LETTER 215

April 16, 1999

Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Sirs,

I'm sure you are all well aware of all the issues regarding the proposed expansion of Logan Airport with runway 14/32. As the proposal is coming up for review at your office in just a few short days, I wish to register my strong opposition to the plan. The cons are well known; increased air and noise pollution are just two of them. There is also a reason to consider the environmental justice of the proposal. No one can reasonably see the addition of the runway as anything but expansion. But if we are all going to enjoy the benefits of increased air travel, we must all take on the burdens that come with it. Massport must go back and look at all options, including, but not limited to, increased reliance on rail travel and the development of a regional transportation plan before considering new runways. Massport has not done their job. My family and I urge you to let them know in no uncertain terms that this is the case. Thanks for your time.

215.1

215.1	General Opposition		...As the proposal is coming up for review at your office in just a few short days, I wish to register my strong opposition to the plan. The cons are well known; increased air and noise pollution are just two of them. There is also a reason to consider the environmental justice of the proposal. ...	The Environmental Justice analysis in Section 6.8 was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.
215.2	Regional Transportation	Regional Airports	... Massport must go back and look at all options, including, but not limited to, increased reliance on rail travel and the development of a regional transportation plan before considering new runways.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of the Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 216

Dear Mr. Pugsley,

I am writing to voice my concern over plans to expand Logan Airport's runways. Massport's Environmental Impact study is inadequate because it uses 1993 data instead of 1998 data, AND because it doesn't look at the health and environmental problems or the economic losses (real estate devaluation) that will be caused by Runway 14/32. 216.1 216.2

I hope that you will consider these concerns and the negative impact they will have on our neighborhood. Thank you.

Sincerely,

Barbara McDonough
Hilltop Street
Chester, Ma 02124

Code	Topic 1	Topic 2	Comment	Response
216.1	Analysis Assumptions/ Methodologies	Base Year	I am writing to voice my concern over plans to expand Logan Airport's runways. Massport's Environmental Impact Study is inadequate because it uses 1993 data instead of 1998 data.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. The appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year.
216.2	Public Health	Effects	Massport's Environmental Impact Study is inadequate because it doesn't look at the health and environmental problems or the economic losses (real estate devaluation) that will be caused by Runway 14/32.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..." The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives.

LETTER 217

April 21, 1999

John C. Silva
Manager, Environmental Programs
Airports Division, FAA-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Secretary of Environmental Affairs
Attention MEPA Office
Arthur Pugsley - EOEA # 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Mr. John Silva and Arthur Pugsley:

In response to the Draft Environmental Impact Statement Report [EOEA #10458] presented by Massachusetts Port Authority for Logan Airside Improvements Planning Project, I find the draft EIS/EIR report insufficient in content to make an informed decision regarding the environmental impact of these improvements on the surrounding communities. I present the following questions as a condo owner and resident of Dorchester, MA.

1. Pages ES-22 and ES-23 indicate a 2 mile inland impact of Day/Night Sound Levels – 65 dB contours for Alt.1A and Alt.4. However, more traffic has consistently traveled over Roxbury and parts of Dorchester (a radius in excess of 2 miles from Logan airport) during the period of sampling. How can the model produce accurate results when the radius of land covered is grossly understated for data sampling and how can anyone (including Massport) conclude that one alternative provides less noise over another alternative when the data sampled is deficient and excludes critical noise level exceedances? 217.1
2. How was the noise level sampling collected in Roxbury?
   a) Specifically what time of day and/or night and in what frequency and over how many days or months were the data collected to assess sound levels?
   b) Did the sampling days and times coincide with the increased operations flying over Roxbury and Dorchester?
      I. If not, how can the model used by Massport be accurate in its assessment of the sound level impact to communities south of Roxbury and Dorchester?
      II. If so, what were the noise levels recorded and how many occurrences of noise exceedances were detected by the monitor? 217.2
   c) Was the noise monitor in proper working order every day from the original placement to the final removal day of the noise monitor?
      I. If not, how many days and number of hours did the noise monitor fail to operate in proper working order?
      II. Was the failure of the noise monitor detected and replaced? At what period did this occur and what workarounds or testing was implemented?
3. As a result of increased traffic over Roxbury and Dorchester from delays at Logan, why did the FAA not review these two low income minority communities to determine whether they qualify for impacted community status? 217.3 Why did the FAA not request an increase in noise monitoring and payment by Massport for sound proofing of public and private property affected by excessive noise levels when the flight path was changed to fly over Roxbury and Dorchester which prompted excessive noise level complaints by community residents? 217.4

4. In assessing noise levels and determining the classification of an impacted community, what is FAA's role in controlling or preventing planes from flying below legal and/or acceptable levels over communities such as Roxbury or Dorchester that do not directly abut the airport? 217.5

5. Page 6-105, Table 6.6-3 compares existing Logan soil quality data with Logan modernization unregulated soil criteria.
   a) Where is the soil quality data from test samples for the runway to be built into the water? 217.6
   b) What is MEPA's role in halting or delaying construction of a runway if it is determined that the cost of removing or remediating contaminated soil greatly exceeds Massport's budget and greatly outweighs any financial or environmental benefits of building the new runway? 217.7
   c) Does MEPA think it is prudent to proceed with construction of a runway into water that flows into a larger body of water without collecting soil samples from the proposed construction site to determine progressive environmental impact to marine life and the quality of soil and cost of disposal or remediation? 217.8

Respectfully submitted,

Karen L. Rucker

Code	Topic 1	Topic 2	Comment	Response
217.1	Noise	Model	Pages ES-22 and ES-23 indicate a 2-mile inland impact of Day/Night Sound Levels--65 dB contours for Alt. 1A and Alt. 4. However, more traffic has consistently traveled over Roxbury and parts of Dorchester (a radius in excess of 2 miles from Logan Airport) during the period of sampling. How can the model produce accurate results when the radius of land covered is grossly understated for data sampling and how can anyone (including Massport) conclude that one alternative provides less noise over another alternative when the data sampled is deficient and excludes critical noise level exceedances?	The contours in Figures ES-5 and ES-6 on pages ES-22 and ES-23 of the Airside Project Draft EIS/EIR are for Day/Night Sound Levels (DNL) of 65 dB. The analysis extended much further from Logan Airport than required for the 65 dB DNL contours and for the 60 dB DNL contours which may be found in the Appendix E of the Supplemental DEIS/FEIR. The analysis in Roxbury and Dorchester included representative flight tracks over each community, with annual average aircraft operations on each flight track, so that aircraft noise was accounted for in each community.
217.2	Noise	Impacts	How was the noise level sampling collected in Roxbury? a) Specifically, what time of day and/or night and in what frequency and over how many days or months were the data collected to assess sound levels? b) Did the sampling days and times coincide with the increased operations flying over Roxbury and Dorchester? I. If not, how can the model used by Massport be accurate in its assessment of the sound level impact to communities south of Roxbury and Dorchester? II. If so, what were the noise levels recorded and how many occurrences of noise exceedances were detected by the monitor? c) Was the noise monitor in proper working order every day from the original placement to the final removal day of the noise monitor? I. If not, how many days and number of hours did the noise monitor fail to operate in proper working order? II. Was the failure of the noise monitor detected and replaced? At what period did this occur and what work-arounds or testing was implemented?	Noise data were acquired in Roxbury for the tests of the Runway 27 departure procedure in the winter of 1991 to 1992. These data indicated a reasonable correlation between measurement and modeling based on the radar tracks. In 1997, a permanent noise monitor was installed in the Boston Latin Academy in Roxbury under the new flight path. The data for part of 1997 were reported in the 1997 Annual Update in Table 5-5, and the data for 1998 were reported in the 1998 Annual Update in Table 5-6. The 1998 data show both the total noise and the total noise from aircraft, as well as the INM-calculated values of DNL. The agreement is excellent.

Code	Topic 1	Topic 2	Comment	Response
217.3	Environmental Justice	Impacts	As a result of increased traffic over Roxbury and Dorchester from delays at Logan, why did the FAA not review these two low income minority communities to determine whether they qualify for impacted community status?	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
217.4	Noise	Soundproofing	Why did the FAA not request an increase in noise monitoring and payment by Massport for soundproofing of public and private property affected by excessive noise levels when the flight path was changed to fly over Roxbury and Dorchester which prompted excessive noise level complaints by community residents?	The delays at Logan Airport did not increase air traffic over Roxbury and Dorchester and may have reduced such overflights. Because of the concern for the noise under the new departure heading (235 degrees magnetic), Massport has added two new noise monitors, Monitor No. 27 in Roxbury and Monitor No. 29 in Mattapan. However, the noise levels in these two communities are less than the minimum criteria for FAA approval of a sound insulation program.
217.5	Noise	Impacts	In assessing noise levels and determining the classification of an impacted community, what is FAA's role in controlling or preventing planes from flying below legal and/or acceptable levels over communities such as Roxbury or Dorchester that do not directly abut the airport?	The FAA establishes standard arrival and departure procedures, which provide for the safe and expeditious flow of air traffic. It is FAA noise policy to select flight tracks and altitudes to minimize noise exposure. The departure procedure for Runway 27, for example, was established through a lengthy public Environmental Impact Review involving the FAA, Massport and all interested communities.
217.6	Soil/Sediment	Testing	Where is the soil quality data from test samples for the runway to be built into the water?	The runway will not be built into Boston Harbor. All construction is confined to upland areas of the existing airfield. Airfield soil sample data are presented in Section 6.7 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
217.7	Environmental Review Process	MEPA	What is MEPA's role in halting or delaying construction of a runway if it is determined that the cost of removing or remediating contaminated soil greatly exceeds Massport's budget and greatly outweighs any financial or environmental benefits of building the new runway?	The requirements for removing or remediating soil for the Airside Improvements have decreased from the estimates in the Airside Project Draft EIS/EIR because both the volume of soil to be removed and the level of contamination in the soil is much lower than anticipated at the time of the Airside Project Draft EIS/EIR analysis. The volume of excavate has been reduced as a result of the on-going removal of stockpiled Central Artery/Tunnel soil material from Governors Island, and the findings of a subsurface investigation program show that much of the existing soil material on the airport is suitable for construction and therefore does not have to be removed. Refer to Section 6.7 of the Supplemental DEIS/FEIR.
217.8	Soils	Testing	Does MEPA think it is prudent to proceed with construction of a runway into water that flows into a larger body of water without collecting soil samples from the proposed construction site to determine progressive environmental impact to marine life and the quality of soil and cost of disposal or remediation?	See response to comment 217.6.

LETTER 218

Dear Secretary Durand,

My husband and I have lived in East Boston since 1976. In 1982 when we decided to buy a home here, we called Massport and asked them to outline their long range plans. They had nothing to say about future expansion plans. We also asked them for their best advice on soundproofing as we planned extensive renovation to our home and sought to incorporate soundproofing (at our own expense) into our plans. Massport sent a representative over to find out what we were doing as they had no expertise to offer! As you can see, the decision to live in East Boston was a deliberate one and we did our homework. Why did we decide to make our home in East Boston? It minimized our daily commuting difficulties, it was affordable, its community spirit was heartening. These reasons still stand today.

East Boston is a neighborhood determined to survive and thrive despite the failure of government in the past to protect its residents from harm. It is a black mark on the Commonwealth to this day that a great park - Wood Island Park - was destroyed to build Logan Airport. Talk about environmental injustice! This was not a democratic decision, made in the light of day. The current Massport proposal is of the same ilk. It did not emerge in the light of day. It would not survive a democratic vote, because it is a bad plan, and not just for East Boston. It will choke the city with traffic, it will increase the noise that residents experience, it will negate the progress made in creating more parks and outdoor recreation areas for Boston's families and residents. These harmful results, which cannot be mitigated, were not give serious consideration in Massport's proposal.. 218.1

I attended Boston City Councilor Paul Scapicchio's hearing on March 2 and both MEPA hearings on April 6 and April 7. The arguments against Massport's plan were well stated at these public meetings and I will not restate them here. The executive summary of the CAC's report details the problems and the deficiencies of Massport's proposal. It is clear that Massport's proposal exacerbates the environmental problems we city dwellers already have.

I would like to comment on the arguments I heard from those business interests that spoke in favor of the proposal. In every case the proponents were talking about benefits to people who are in Boston only for a short time - a business traveler, a tourist, perhaps a person who works in Boston, but does not live here. As old as I am, I was still astounded at the willingness of the proponents to sacrifice the well-being of the residents of Greater Boston for "jobs" as Paul Guzzi did or "tourists and conventioneers" as Gloria Larson did. Putting that aside, I tried to look at the business sense of it. Where would the businesses that operate in Boston have their work force live? It is counterproductive to force employees to live farther and farther away from their place of work. The daily commuting problems are already horrendous. Without the investment in regional ground transportation, getting to work will be even worse, if that can be imagined, than it is now. Massport's proposal does not take these factors into consideration either. 218.2

By denying Massport's proposal, you will be protecting the residents of Greater Boston from environmental harm, you will be encouraging a more thoughtful, long-range solution to our transportation needs, and you will prevent further wasteful expenditure of public moneys on this ill-conceived proposal. As citizens, taxpayers, voters and home owners in East Boston, my husband and I hope you will make a decision that will truly be in the interest of the Commonwealth and deny Massport's DEIS/EIR #10458. Surely, what is good for the one and a half million residents of the Boston metropolitan area will be for the good of the Commonwealth as well.

Sincerely,

Carolyn Banulis
Brent Banulis

Code	Topic 1	Topic 2	Comment	Response
218.1	General Opposition		...The current Massport proposal...will choke the city with traffic, it will increase the noise that residents experience, it will negate the progress made in creating more parks and outdoor recreation areas for Boston's families and residents. These harmful results, which cannot be mitigated, were not given serious consideration in Massport's proposal.	Comment noted.
218.2	General Opposition		...Without the investment in regional ground transportation, getting to work will be even worse, if that can be imagined, than it is now. Massport's decision does not take these factors into consideration either.	Section 2.3 of the Supplemental DEIS/FEIR discusses the specific role played by the regional alternatives and steps Massport has taken to foster increased use of these alternatives. Massport has long recognized and been a proponent of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million passengers that could be accommodated by regional alternatives that include use of T.F. Green/Providence, Manchester, and Worcester Regional airports, as well as the introduction of high-speed rail to New York in December 2000. In the Supplemental DEIS/FEIR, Massport undertook analysis of the passenger traffic development patterns at Logan Airport and the regional airports. Based on this analysis, Massport estimates that Logan Airport may only achieve approximately 34 million passengers by 2010 instead of the previously forecasted 37.5 million passengers. The updated forecast reflects the attractiveness of the regional airports and the availability of high-speed rail to New York, Boston's largest air travel market.

LETTER 219

Robert Durand
Massachusetts Environmental Policy Agency
100 Cambridge Street, Suite 2000
Boston, MA 02202

Dear Mr. Durand,

Re: EOA 10458

The purpose of this letter is to outline for you my reasons for being in strong opposition to the Massachusetts Port Authority's proposed new runway, otherwise known as Runway 14/32, the proposed centerfield taxiway, and the proposed reduced minimums for deciding whether to abort a landing near my home.

The existing court-ordered injunction against the runway serves to protect the environmental interests of East Boston residents and should not be overturned. The reasoning behind the injunction remains sound: our community should not be asked to absorb additional negative environmental burdens, without all other alternatives having been studied and serious implementation of all alternatives attempted.

Please do not be swayed by the argument that this runway is needed to help alleviate delays at Logan International Airport for the tourist industry or for business travelers coming to Boston. By Massport's own figures, fully 57% of all passengers arriving at Logan or departing Logan are residents of communities located west of Routes I-95 and I-495. Clearly the logic of siting another airport nearer to those residences cannot be denied. Such a new airport would serve to enhance the justice of not allowing more negative burdens here in Boston and would bring those passengers closer to their homes. 219.1

I would also ask that you consider the impact the airport currently has on the health of residents of East Boston. Our children's overall well being is compromised daily by the negative effects of the pollution created by the airplanes and the attendant traffic going to and from Logan. That includes cars, taxis, limousines, and cargo trucks. The infrastructure of our community cannot withstand additional burdens, which would be evident if Runway 14/32 is built. 219.2

Massport's presentations have alluded to the 5000-foot runway as being primarily for commuter planes and being necessary because of the wind patterns here in Boston. Well, a runway a mere 280 feet short of a mile, accommodating 100-passenger jets, creates an unfair environmental burden on East Boston. With careful planning, another airport could be designed with a runway configuration that would take into account all possible wind patterns and the problem would not be duplicated. 219.3

I live in the Bayswater section of Orient Heights. The proposed centerfield-taxiway will only serve to burden further our area with airplane-related pollution as more and more planes are allowed to fill that taxiway. Similarly, I am against zero-visibility landings using Runway 22L—also very near to my home—because if a pilot decides to abort a landing, he/she will accelerate the plane's engines over the water near to Bayswater Street, causing further concussions to the homes in the adjacent area. Massport has shown that body of water to be Boston Harbor, when, in fact, it is the bay near our homes. 219.4

For the health of all persons in East Boston, who are trying to live a somewhat reasonable quality life, and who should not be considered expendable to satisfy the needs of the travelling public, I ask that your agency deny Massport's request to sanction Runway 14/32. This is issue has clear environmental justice implications and your decision must be based on that consideration. 219.5

Thank you for taking the time to consider my concerns, and those of other residents, as you begin to make your decision about this proposal.

Sincerely,

Mary C. Berninger

219.1	Regional Transportation	Regional Airports	Please do not be swayed by the argument that this runway is needed to help alleviate delays at Logan International Airport for the tourist industry or for business travelers coming to Boston. By Massport's own figures, fully 57% of all passengers arriving at Logan or departing Logan are residents of communities located west of Routes I-95 and I-495. Clearly the logic of siting another airport nearer to those residences cannot be denied. Such a new airport would serve to enhance the justice of not allowing more negative burdens here in Boston and would bring those passengers closer to their homes.	Massport considers Logan Airport to be part of a regional system of airports that includes the Providence, Manchester and Worcester Regional airports. Service developments and increased traffic at these airports are an important component of the region's long-term strategy to accommodate passengers and activity growth. By its agreement to assume operational responsibility and the eventual ownership of the Worcester facility, Massport is working to increase air services at Worcester Regional Airport and its role in accommodating air travel demand generated in communities west of I-95 and I-495. Greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
219.2	Public Health	Effects	I would also ask that you consider the impact the airport currently has on the health of residents of East Boston. Our children's overall well being is compromised daily by the negative effects of the pollution created by the airplanes and the attendant traffic going to and from Logan. That includes cars, taxis, limousines, and cargo trucks. The infrastructure of our community cannot withstand additional burdens, which would be evident if Runway 14/32 is built.	The proposed Airside Project will not stimulate additional growth in passenger activity levels at Logan Airport. Off-site motor vehicle emissions estimates are shown in Table 6.4-9 of the Supplemental DEIS/FEIR. Increases in the number of vehicles accessing Logan Airport are not analogous to increases in emissions. As indicated in the table, these emissions generally decrease in the future, as a result of improved motor vehicle emission standards, the increased use of alternative fuels, and other factors. The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative. Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas. Massport is actively involved in many air quality initiatives and explored other options to reduce emissions from activities at Logan Airport in the *Logan Airport 1999 ESPR* (previously GEIR).
219.3	Regional Transportation	Regional Airports	...a runway a mere 280 feet short of a mile, accommodating 100-passenger jets, creates an unfair environmental burden on East Boston. With careful planning, another airport could be designed with a runway configuration that would take into account all possible wind patterns and the problem would not be duplicated.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.

Code	Topic 1	Topic 2	Comment	Response
219.4	Alternatives	Reduced Approach Minima	I am against zero-visibility landings using Runway 22L--also very near to my home--because if a pilot decides to abort a landing, he/she will accelerate the planes' engines over the water near to Bayswater Street, causing further concussions to the homes in the adjacent area.	Zero visibility landings (i.e. Category III Approach minimums) are not proposed for Runway 22L. The minimums on Runway 22L will be reduced to Category I standards consistent with the equipment already installed. Aircraft will still follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach procedure will be initiated will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise such as the Day-Night Sound Level (DNL), but are rather single aircraft events. The noise from a missed approach is at maximum value just after engine thrust has been increased for the climb-out. For example, reducing the Runway 22L decision height to 200 feet moves this maximum noise point to approximately 3,000 feet from touchdown and further from populated areas in East Boston than is currently the case. Although normally categorically excluded from the NEPA review, the Airside Project study included modeling of changes in runway availability due to reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result.
219.5	General Opposition		For the health of all persons in East Boston, who are trying to live a somewhat reasonable quality life, and who should not be considered expendable to satisfy the needs of the traveling public, I ask that your agency deny Massport's request to sanction Runway 14/32. This issue has clear environmental justice implications and your decision must be based on that consideration.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative.

COMMENT PROCEDURE for: Draft Logan Airside Improvements (a.k.a. Runway 14/32) **EOEA #10458**

All comments on EIRs (environmental impact report) must refer to the EOEA file number. There may be other identifying numbers, but the EOEA file number is the one which must be used.

LETTER 220

Comments not referring to the EOEA file number may not be considered.

All comments must be received April 22, 1999
All mail concerning the environmental impact review process including filings, comments, and all associated materials must be addressed to:

Bob Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. **#10458**

Boston, MA 02202

Dear Mr. Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows:

There are toxic fumes in the air and I am breathing into my lungs. I do definitely hope you take some severe disciplinary action against the people who want to expand the runway. "The Blute Crew" we dub these people - only because they think runway expansion is a good idea. Please take action immediately so my reputation and health are not laying waste. 220.1

It is difficult to express my tremendous concern about Massport Authority's plan to expand airport transportation through the building of runway 14/32 a second taxiway, and lower ceiling height for landing aircraft at Logan.

As a lifelong resident of East Boston, it does not seem possible that a community with limited resources can successfully win an argument against this expansion. The Massport Authority can send representatives to the Greater Boston Chamber of Commerce and other businesses to argue their mutual need. Massport has the capital to invest in subliminal TV ads on the CNBC and local broadcast networks. Therefore, it becomes incumbent upon your agency to represent the citizen of Boston in its review of Massport's plans for Logan Airport.

Commonwealth of Massachusetts participates in the air transportation provided at Logan - not just East Boston and its surrounding communities. It is a compliment to believe that all travels through Logan are coming to Boston; but common sense says that is not true. The 128 and 495 beltways present evidence of the expansion of business outside the Boston area. These businesses and communities are best served by a second airport. 221.1

As Massport presented to this community, the airport is good for economic development. A second airport has the potential to employ up to 15,000 people, to hook up to high speed rail, and improved infrastructure of the host community. Travelers would be 30 to 45 minutes closer to home or their business destinations.

A second airport would not deny the Boston businesses and tourist the availability of air transportation. A second airport would offer choices to travelers, offer better air and ground transportation while in Boston, and reduce travel time for those traveling outside the Boston area.

Logan Airport has reached its capacity; a sixth runway is not the solution.

An afternoon at Constitution beach in East Boston will provide us with clear visual and audible reasons why a second taxiway is harmful to our environment. The jet noise, rumbling and exhaust fumes have a negative impact on the residents of Orient Heights and beach goers alike. To add a second taxiway, center field or 221.2

not, will not increase the benefits to this community.

It is almost impossible to believe that your organization would approve of lowering the ceiling on landing heights. It is already possible to see the passengers on the planes as the fly over East Boston and Winthrop to land at Logan.

221.3

Massport has not met its obligation to develop an air and ground transportation system that meet the needs of the Commonwealth of Massachusetts. It has placed all the responsibility on a small island called East Boston and the impact has affected the quality of life of all Bostonians and neighboring communities near and far.

With all due respect, I request that you deny the request for addition environmental damages; deny Massport Authority's request to lift the injunction; and deny the development of runway 14/32, a center field taxiway and lower landing heights.

Thank you for your time and consideration of this important issue.

Catherine Brayden

221.1	Regional Transportation	Regional Airports	...The 128 and 495 beltways present evidence of the expansion of business outside the Boston area. These businesses and communities are best served by a second airport...A second airport has the potential to employ up to 15,000 people, to hook up to high speed rail, and improved infrastructure of the host community. Travelers would be 30 to 45 minutes closer to home or their business destinations. A second airport would not deny the Boston businesses and tourists the availability of air transportation. A second airport would offer choices to travelers, offer better air and ground transportation while in Boston, and reduce travel time for those traveling outside the Boston area.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.
221.2	Alternatives	Taxiway Improvements	...The jet noise, rumbling and exhaust does have a negative impact on the residents of Orient Heights and beachgoers alike. To add a second taxiway, center field or not, will not increase the benefits to this community.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-8 of the Supplemental DEIS/FEIR. The Airside Project leads to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. However, decreases in odorous emission concentrations will be imperceptible.
221.3	Regional Transportation	Regional Airports	Massport has not met its obligation to develop an air and ground transportation system that meet the needs of the Commonwealth of Massachusetts.	Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 of the Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 222

CHARLES I. CANN, III
20 LEVERETT AV., #6B
E. BOSTON MA., 02128
APRIL 11, 1999

DRAFT EIR
ROBERT DURAND, SECRETARY
OF ENVIRONMENTAL AFFAIRS
ATTN MEPA OFFICE
MR. ARTHUR PUGSLEY -
EOEA # 10458

DEAR MR. PUGSLEY,
I'M WRITING YOU TO ASK YOU TO REJECT MASSPORT'S PLAN TO BUILD RUNWAY 14/32 - CENTER TAXIWAY. FOR MANY YEARS THE PEOPLE OF EAST BOSTON AND SURROUNDING COMMUNITIES HAVE BEEN PLAGUED WITH NOISE, CONJESTION, AND AIR POLLUTION AS A DIRECT RESULT OF LOGAN AIRPORT.

I LIVE IN THE ORIENT HEIGHTS/ BEACHMONT SECTION OF EAST BOSTON. A FEW WEEKS AGO, I ATTENDED AN INFORMATIONAL MEETING SPONSORED BY MASSPORT. I ASKED BETTY DESROSIERS WHAT WOULD HAPPEN

IF 14/32 WAS BUILT, I ASKED MCR IF ALL THE SMALLER PLANES WOULD USE THE NEW RUNWAY AND SHE SAID YES, WHICH LED ME TO BELIEVE THAT ONLY SO-CALLED CLASS 3 AIR PLANES WOULD FLY OVER MY HOUSE. THE CLASS 3 PLANES, L1011'S AND 747'S ARE THE ONES THAT MAKE THE MOST NOISE! YOU CAN'T SIT ON YOUR PORCH, USE YOUR YARD OR TALK TO YOUR NEIGHBORS OUTSIDE WITHOUT SHOUTING MASSPORT HAS EVEN ADMITTED THAT. THEIR MONITORING OF NOISE IS FLAWED. IN SUMMER THE SMELL OF JET FUEL IS ALMOST UNBEARABLE EVEN IN WINTER WITH SOUNDPROOF WINDOWS, THE HOUSE STILL SHAKES AND YOU STILL HEAR THE PLANES AND SMELL THE JET FUEL. 222.1

THEY TELL US THAT THE CENTER TAXIWAY WILL MEAN PLANES WILL BE ABLE TO MOVE TO AND FROM THE TERMINALS FASTER SO THERE WILL BE LESS AIR POLLUTION, BUT IT SEEMS THAT MORE PLANES MEANS MORE JET ENGINES RUNNING WHICH SEEMS 222.2

TO ME TO TRANSLATE TO MORE JET FUEL AND MORE NOISE. AND IF THEY LOWER THE MINIMUM HEIGHT, THE PLANES WILL BE FLYING EVEN LOWER OVER MY HOME AND MY NEIGHBORHOOD. A FRIGHTENING THOUGHT INDEED! HOW ENVIRONMENTALLY FRIENDLY MASSPORT IS TO BE WILLING TO SPEND $200,000 TO MOVE AN ENDANGERED BIRD! WE LIVE NEAR THE AIRPORT SO WERE NOT ENTITLED TO HAVE ENDANGERED BIRDS!

ONE DAY LAST WEEK AROUND 7:30 IN THE EVENING I HAD TO WAIT FOR FOUR 18 WHEELERS ON OUR CITY STREETS TO GO TO THE AIRPORT. LAST FRIDAY I HAD TO WIND AROUND TWO SHUTTLE BUSES A STRAIGHT TRUCK AND AN 18 WHEELER AT THE SAME INTERSECTION. WERE INUNDATED WITH AIRPORT TRAFFIC ALL THE TIME ALONG WITH TAXIS, LIMOSINES OIL TRUCKS, SHUTTLE VANS AND GENERAL AIRPORT TRAFFIC.

IN THE MOVIE "FIELD OF DREAMS" THE EXPRESSION WAS.

"IF YOU BUILD IT, THEY WILL COME."
WELL, THEY'RE ALREADY HERE!

I'VE READ LETTERS AN EDITORIALS ABOUT THE PEOPLE SURROUNDING HANSCOM FIELD COMPLAIN ABOUT THREATS ABOUT QUALITY OF LIFE AND HISTORICAL SIGNIFICANCE. WHAT ABOUT OUR QUALITY OF LIFE AND OUR HISTORY?

T. F GREENE AIRPORT AND MANCHESTER AR EXPANDING THEIR OPERATIONS BECAUSE THEY KNOW LOGAN IS TOO SMALL TO HANDLE ANY MORE TRAFFIC. WORCESTER AIRPORT HAS BEEN LOSING BUISNESS BECAUSE OF LACK OF FACILITIES. ONLY RECENTLY HAS MASSPORT BEGUN TO ADDRESS WORCESTER'S POSITION ON A REGIONAL BASIS.

ALL WE EVER HEAR FROM THE BUSINESS PEOPLE AND AIRLINE SPOKESPEOPLE IS HOW GOOD THIS PLAN WILL BE FOR OUR ECONOMY 222.4

WHAT ABOUT THOSE OF US THAT BEAR THE BRUNT OF MASSPORT OPERATIONS? IS ECONOMICS MORE IMPORTANT THAN PEOPLE?

DOES A "MORE EQUITABLE DISTRIBUTION OF NOISE MEAN ONLY THE WORKING CLASS COMMUNITIES AROUND LOGAN?

DO ENDANGERED BIRDS HAVE MORE OF A CHANCE FOR SURVIVAL THAN ENDANGERED PEOPLE?

I BELIEVE THAT IF THEY COULD, MASSPORT WOULD MOVE US ALL AWAY FROM LOGAN AND TAKE OUR HOMES JUST AS THEY DID TO THE PEOPLE ON NEPTUNE ROAD. NO AMOUNT OF MITIGATION OR STOP GAP MEASURES CHANGES THE FACT THAT WE NEED A SECOND AIRPORT. LOGAN HAS REACHED ITS CAPACITY, AND LONG SINCE PASSED IT 222.5

DO PEOPLE NOT GO TO PARIS OR LONDON BECAUSE THEIR AIRPORTS ARE OUTSIDE THE CITY AND MUST BE ACCESSED BY BUSES OR TRAINS? DO PEOPLE NOT GO TO SAN FRANCISCO BECAUSE OF WEATHER DELAYS. I DON'T THINK SO.

PLEASE DON'T BE SWAYED BY BIG BUISNESS OR MASSPORT RHETORIC

PLEASE LISTEN TO THE PEOPLE WHOSE LIVES ARE AFFECTED THE

MUST. HOPEFULLY IT'S NOT
TOO LATE TO STOP THE MADNESS.

AT LEAST THEY DIDN'T PROMISE
THEY'D CHANGE THE WEATHER.
WE KNOW THEY COULDN'T KEEP
THAT ONE!

SINCERELY

Charles L. Camillo

Code	Topic 1	Topic 2	Comment	Response
222.1	Noise	Monitoring	Massport has even admitted that their monitoring of noise is flawed.	In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Planning and Status Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix E of the *Logan Airport 1996 Annual Update).*
222.2	Alternatives	Taxiway Improvements	They tell us that the center taxiway will mean planes will be able to move to and from the terminals faster, so there will be less air pollution. But it seems that more planes means more jet engines running, which seems to me to translate to more jet fuel and more noise.	The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative. The Centerfield Taxiway is designed to increase operational efficiency and reduce taxiway delays, but construction of the taxiway will not lead to an increase in operations. None of the proposed airfield improvements will induce demand by new passengers or operations that would otherwise not come to Logan Airport.
222.3	Alternatives	Reduced Approach Minima	And if they lower the minimum height, the planes will be flying even lower over my home and my neighborhood.	Reduced landing minimums provide for a safer approach by providing precision guidance at lower altitudes, and thus a safer approach The reduced landing minimums do not change the approach path nor reduce the clearance between aircraft and the surface. Rather, they shift the location at which a missed approach decision is initiated closer to the airport. For Runways 27 and 22L, the reduced minimums will make the approach procedures flown by pilots more consistent with FAA standards in effect at most other airports. Reduced landing minimums will increase airfield safety by allowing operations more directly into the prevailing wind and will help improve PRAS goal achievement.
222.4	Alternatives	Impacts	All we ever hear from the business people and airline spokespeople is how good this plan will be for our economy. What about those of us that bear the brunt of Massport operations? Is economics more important than people [are]?	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
222.5	Regional Transportation	Regional Airports	No amount of mitigation or stop-gap measures changes the fact that we need a second airport. Logan has reached its capacity, and long since passed it.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields. Airport capacity varies according to weather conditions and traffic volume as well as the airfield layout, facilities and equipment such as ILS, and operational procedures such as approach minimums and aircraft separations.

LETTER 223

Mr Durand, Arthur Pugsley:

I am writing to let you know I am opposed to the construction of runway 14/32 I honestly do not think it will help the environment of our air + noise 223.1
I was at the meeting at the Holiday Inn 4-8-99 and it seemed most everyone felt the same way. I hope you will 223.2
Consider a second airport. There were people from several areas at the meeting in opposition to runway 14/32. Thank you for taking the time reading my request.

Mrs Catarina D'Amore
62 Haynes St
E. Boston Ma

Re: "Logan Airside Improvements"

23 pages

I would like to go on record as OPPOSED to the ludicrous, as well as unconscionable Masspoit Plans for additional Expansion of Logan International Airport. The surrounding communities have taken an unfair burden, and decades of negative environmental impacts, demise of quality of life and, degragation of neighborhoods, and the community as a whole as a result of the uncontrolled growth Logan International Airport. Enough is enough!! Our lives are at risk!! 224.1

It is my understanding that the "Planning Project" reports are flawed.

However, I will leave the assessment of the reports to those with the technical expertise to make such evaluation.

Therefore my response will address those issues frequently ignored in the planning process, and, in the "response" to technical reports. Although important, and in some cases critical to the health and safety of human beings, as well as wildlife, to the stability of neighborhoods as well as the survival of viable residential communities, they tend to become low priority items when it comes to competition with business industry, and, the "almighty dollar"

PART I - Planners, decision makers and funding agencies must be cognizant and practitioners of:

224.1 (cont.)

- Environmental Responsibility
- Environmental Justice
- Methods of improving quality of life of those who live, work and play in East Boston / other Communities
- Prevention, not exacerbation of the degragation / deterioration of neighborhoods contiguous to the airport and/or under the flight patterns.

Who will / must be responsible for

Re EOEA 10458
Cruise Line Angelin

- danger to life and limb for residents?
- degradation of the health of
- deterioration of environment?
- deterioration of quality of life?
- exacerbation of air, water, soil noise and visual pollution?
- the insidious, as well as blatant intrusion and extreme negative impacts upon the lives of the residents of the contiguous neighbo

Part II — Harbor Clean up & Toxic Wast

Loss of incredibly invaluable historic sites and open/green space and parkland, and, 3 harbor islands. (not to mention innumerable homes, business streets)

Governor's Island - Fort Wash (the first) Fort Winthrop, a richly historic site which should have preserved as part of the rich heritage of America (such as the 2nd Fort Warren at Castle Island South Boston) was instead, bulldozed and filled in along with Apple Island, Bird Island World war I Memorial Park - Wood Island Park designed by Frederick Law Olmsted,

224.2

RECEIVED 10-4-55

Edith G. Delangelis

America Park and America Field for airport expansion. To add insult to injury, toxic waste, too contaminated for designated outer harbor foul disposal area was dumped into Governor's Island, despite our efforts to stop such an outrageous proposal!

224.2 (cont.) Despite our grave concerns about the potential consequences, now and for generations to come Massport and the Ma. Highway Department proceeded to dump more hazardous waste in East Boston! Incidentally the largest percentage of 21E sites of Ma. D.E.P. are on Massport property.

224.3 Taxpayers and especially local BWSC rate payers are spending billions of dollars to clean up Boston Harbor.

Questions — What happens to our clean harbor if a contractor accidentally or deliberately breached the capsule containing the toxic waste??

Re: CCCT 10455
East Boston

It was my understanding that the Capsule would never, should never be breached (for obvious reasons) What will the construction of the proposed runway do to this so called/concealed/protected hazardous waste? What will happen to the air the water, the soil not only in East Boston but all along the waterways? The disposal sites must not be tampered with in any way for any purpose!

224.4

224.5

Part III - "Law of averages"

As the percentage of flights increase over our homes and communities, we need to have some questions answered! We also must prevent catastrophic conflagrations, the potential of which increases with each new plane and flight pattern added to a sky already super saturated with all types and sizes of aircraft.

224.6

Re: EBEA 10458
Edith G. DeAngelis

Questions which require a response
& yearly account of at least the
last five years:

- How many flights leaving Logan have been aborted due to
  - faulty equipment?
  - smoke in the Cockpit or Cabin
- How many "near misses" of planes flying over New England?
- How many flights, not from Logan have had to make emergency landings?

224.6 (cont.)

- How many incidents of unruly passengers in flights over New England?
- How many disabled planes unscheduled on Logans roster have had to land at Logan
- How many planes have gone off the runways?
- How planes approaching or leaving Logan have Crashed? (on and around the airport - Bayswater Street Boston Harbor and/or on the runways or perimeter of the airport?
- Can you not believe that, God forbid, one or more communities

Re: EBEA 6045
Edith Eddy Angelo

could be totally wiped out if a plane were to crash into any of the jet fuel tanks at the airport, the underground jet fuel and gas lines, with all the oil tanks up and down the Chelsea River in East Boston, Chelsea and Revere? We have no escape since they close off the tunnels during emergency situations.

224.7 As the number of flights increases, over land or over water, the potential for plane crashes increases significantly. Since many of the flights also circle or continue to fly over Boston Inner Harbor and the Mystic River where natural gas tanks are located and where the huge L.N.G. tankers travel (just clearing the Tobin Bridge) the potential for a regional conflagration increases significantly!!! I understand that if the runway is built, anticipated number of flights will increase

by 21,000, with a ~~similar~~ greater percentage over the Eagle Hill Neighborhood which is an Historic District with a number of individual buildings on Landmark of the City of Boston listing and on the National Register of Historic Places.

- What is being done to prevent a potential conflagration?

Part IV - Wildlife -

Despite being an urban community, East Boston enjoys many varieties of birds and other wildlife, some rare species. Wood Island Bay Marsh, Belle Isle Marsh Reservation, the runways and perimeter of the airport are rich with opportunities for outdoor recreation, recreational and environmental awareness
224.8 programs. How can we protect the wildlife? How can we provide opportunities for Outdoor Education? What would a new runway do to

our natural environment and rich resources? Of course another fear, as experienced in the past, is the ingestion of birds into the jet motors disabling planes. What happens when we increase flights in and out of Logan, by many thousands

Part V - Infrastructure and Safety

Intrusion around in, and through neighborhoods of East Boston and surrounding communities.

The roadway system to and from the airport is already woefully inadequate, with standstill, gridlock traffic frequently seen not only on the highways but also on many of our neighborhood streets (at least

224.9 twice a day) when either one of the bridges to East Boston/Chelsea (over the Chelsea River) are open. Not only is traffic at a standstill for over 1/2 mile, but local traffic is severely exacerbated by airport related vans, trucks,

Re: 10 [illegible]
Edith [illegible]

limos, taxis, buses, etc further clogging our streets disposing their letter, in addition to all the noxious gasses.

- Route 1A must be depressed from and including the portals of the tunnels (to re-connect East Boston to Bell Circle, Revere — or, at the very least to Boardman Street East Boston. Without a more efficient, functional depress roadway, airport traffic including on the airport roadways will be in a gridlock almost continuously, most especially on high peak hours. This is a critical need now, a new runway can only cause more and greater problems!

224.10

224.11

- A special truck route should be constructed to keep [illegible] off our neighborho[illegible]

Streets / re: 10458 Eastie & Delaglen

- Emergency drills should be implemented and extend beyon the airport boundaries, to

224.12 include the most negatively and, most vulnerable to / Catastrophies: East Boston, Chelsea Revere and Winthrop (at least) as part of the Emergency "civil defense" drills.

224.13 • Stronger measures to enforce "no trucks over 2½ tons" which blatantly drive on restricted streets, many times at excessive speeds.

224.14 • Stronger measures by Massport to prevent airport traffic from spilling over or using short cuts through our neighborhood streets.

- Massport must agressively

224.15 encourage public transportation and discourage the use of private cars to and from the Airport.

Re: EDEA 1045
Edna DeAngelis

- Masspt must discourage airport related business firms and their C.E.O.'s, such as hotels, freight storage warehouses, trucking companies (cargo and small trucks and vans) taxis, rental cars, limo, busses from further encroachment and intrusion into our neighborhoods, as well as, in close proximity to our back and front yards and neighborhoods as a whole!

224.16

224.17 • Masspt must return and develop into a park 4½ acres + replace Ameena Park and Ameena field. taken during uncontrolled airport expansion!

224.18 • Masspt and the F.A.A. must do more to make the airlines more responsive to making their airplanes safer and more quiet!

- Masspt must not build a new runway but m...

EOEA 10457
East Boston

safer, more logical methods of addressing their claimed need for a new runway. A second airport is 25 years behind schedule! Any relief of any type (as they, Massport staff, claim), would be like putting a cup of water on a raging forest fire or putting a band aid on cancer. If any relief results, the relief would be extremely inadequate and very limited in scope and in time, and, the runway would be obsolete before built. Then what??

VI Critical Problems - Too many to list.

East Boston has two times less open/green space per capita, as the city as a whole. We desperately need a massive reforestration of trees and other vegetation, for the desperately needed oxygen for our lungs and well-being, and to

224.19

counteract the poisonous fumes and particles from airplanes and airport related vehicular traffic.

• If Massport gave, and developed, 1,000 plus acres of parkland for the East Boston community, it could never replace Frederick Law Olmsted's "Wood Island Park" Neptune Road, "America Park" and "America Field"!

224.20 • A new runway, with a doubling of flights can only exacerbate an already critical need/problem of our community and surrounding communities.

- Traffic (to and from airport)
- Parking
- Pollution
  - air, water, soil, noise and visual pollution
- Accidents (vehicular) within the boundaries East Boston which:
  - increase accident statistics for our community

Tony Durand
EOEA 10455
Edith DeAngelis

- adds more demand on municipal resources
  - fire department
  - police department
- adds more demand on community resources
- increases the insurance premiums of the residents of East Boston due to airport traveler accidents within our boundaries (another unfair/unjust burden to the residents of E.B.)
- Many other critical needs and problems, not already addressed, would fill many more pages!
- In summary, our health and safety and our overall quality of life must always be the first and foremost consideration
- It is a matter of survival
- Survival of our most valuable asset — our people

224.21

- Survival of our natural Resources
- Survival of our residential Community
- A new runway, or any further expansion of Logan International Airport, and/or the increase in cargo or passenger flights can not will not enhance any of the above critical needs. It can only exacerbate an already critical problem/set of problems we currently face.

VII Flight Patterns

- Current flight patterns are dangerous and noisy. Low flying planes almost take down chimneys and roofs of surrounding homes. Every few seconds our lives are disruptive to conversations, any

224.22

form of communication
listening to radio,
T.V. and life in
general!
One plane (and the
incredible noise)
does not out of sight
when another plane
is in view. The sound
often deafening fur
here has caused
lot of people surround-
ing the airport. Even
on main street Medford
the loud noise and
vibrations from planes
at 3 AM 4:30 AM 6:30
AM (as examples) wake
sleeping individuals.
When that (those)
runway(s) is (are) used
the planes never stop!
(Except when a deepfreeze)
The vibrations, the sound
and the odor are relentless!
The irony is, that the greatest
impact over Eagle Hill, E B,
and, Medford, Ma. is when

Re: EOEA 10458
Edith L. DeAngelis

The flights are taking off or landing on the runway over our beloved and irreplaceable former Wood Island Park (That really rubs the salt in the wound)

- We have already been told by Massport officials that those runways will be used even more, and if the new runway is built Eagle Hill, the most densely populated neighborhood would receive the greatest negative noise impact with some 21,000 increased flights (as a starter). Those flights will also continue to impact Medford and other communities on or under that flight pattern as well and will be totally unbearable if increased!! Enough is enough!! Living and life can be intolerable now because of the overflights traffic, noise and pollution impacts and other related airport activities!

Re: EOEA 10458
Edith Eddy Angelini

VIII

224.23

Airport operations and the proximity to homes and neighborhoods

• Logan International Airport and many of the related business operations i.e. rental car companies, trucking firms, bus van car and limo port impacts are literally and figuratively next to the home front and backyards of the residents of East Boston. It is time for relief and the return/replacement of open green space and developed parkland not a further exacerbation of 1300 plus rent a cars and other negative impacts in our backyards!

• The vibrations, most especially from planes warming up, taking off and landing, make windows shake, buildings vibrate and human beings tremble, birds take off and domestic animals get stressed out! • Those folks who advocate for more expansion of the airport activities and facilities should live abutting the airport! or next to taxi/bus pool or rent a car agencies!

Re: EOEA 10458
Edith Goldingelis

• The jets taking off blast an intense air stream with heat, dust and noxious gases - fumes (you can taste as well as smell) right into the homes and neighborhoods leaving a black trail in the atmosphere. Traditionally, the jets approaching the airport would jettison excess fuel over Belle Isle Marsh, Boston Harbor, the Eagle Hill neighborhood, our homes and our gardens leaving a black trail behind them and contaminating the vegetables and fruits growing in private and community gardens.

• The discharged fuel, fumes, noxious gases, dust and dirt thrown into the air by planes, by vehicles (hundreds of thousands) related to airport activities and vehicles using our neighborhood streets to and from the airport leave layers of black dirt on our homes and cars and a greasy film on our windows which can not be removed, regardless of what cleaning agency is used!

• Can you imagine what our lungs

12:10 45 Earth to DeAngelis

look like?
- Don't try to dry clean clothes outside on a clothesline

IX Epidemiology Study
- What is happening to our lungs? To the entire respiratory system? The circulatory system and other vital organs?
- Why does East Boston have a high incidence of illness and death caused by high blood pressure, heart attacks, cancer, chronic lung disease, asthma, cancer, etc.?
- What will over 21,000 more flights and hundreds of thousands additional vehicle trips through East Boston do to our health, safety and well being???
- a new runway and further expansion of Logan is NOT ACCEPTABLE, our health and our lives are at stake!
- What about our peace of mind? Mental stress? Emotional health?

X Historical Perspective

224.24

Re: 10 Feb 86
Edith Wolkowicz

- "NMB" – "Not in my backyard" syndrome / philosophy – I just dump it all in East Boston, but not... my backyard!
- Approximately twenty or more years ago, it was determined that a second airport was needed, and should have been built at that time.
  - Dover Ma was recommended for the site of the 2nd airport for obvious reasons, within 24 hours Dover was taken off the table.
  - What was not good for the wealthy, and affluent, and influential residents of Dover is not good for the residents of East Boston!
- What was bad for East Boston approximately twenty years ago when the runway was proposed, and an injunction was filed and has been in place ever since, is not only bad for East Boston and surrounding communities now, but can only be magnified and exacerbated if a new runway is installed

Edna Delaney

X. Public Relations - Media Blitz

Ho hum!

What a waste of money to prepare, broadcast at prime time, and have telephone banks in Texas encouraging people to "vote" to approve the runway. They can only ask questions, the operators can not take your statement or vote to deny a new runway, just "yes" and "no" responses and an approval for the runway. I want to go on record once again as I did over the phone, to deny this proposal

XI. Finally, I would like to commend politicians and all other individuals who recognize the problems and negative impacts that airport expansion and operations have caused this, and other communities, and were brave enough to stand up, and say NO more runways! I am personally grateful for their integrity and courage

Edna K DeAngelis

Letter 224

224.1	Environmental Justice	Cumulative Impacts	[Critical issues have been omitted from the planning process including health and safety of the local population and threats to community structure. The decision makers need to consider the environmental justice of expanding Logan and find ways of improving quality of life and protecting the local neighborhoods.]	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas. Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively. Massport is committed to a number of mitigation measures in addition to project-specific mitigation. Refer to Chapter 8 of the Supplemental DEIS/FEIR for a discussion of mitigation measures.
224.2	Open Space/ Parklands	Impacts	[Logan construction has already caused the loss of incredibly invaluable historic sites and harbor islands. The proposed construction and expansion will further jeopardize the harbor that is being cleaned up at cost of "billions of dollars."]	The Preferred Alternative will neither incorporate land from nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site. In addition, Massport prepares the *Logan Airport Annual Update* and the *EDRs* as part of the review process for the Logan Airport GEIR/ESPR, which presents a series of status updates on conditions and environmental mitigation initiatives at Logan Airport. Massport has carefully planned the airside improvements to reduce delays and improve efficiency without the need for harbor intrusion. Stormwater management will employ Best Management Practices to minimize potential adverse impacts to harbor water quality. No adverse impacts to the Harbor, the Harbor Islands or the surrounding areas are anticipated from this project.

Code	Topic 1	Topic 2	Comment	Response
224.3	Water Quality	Monitoring	What happens to our clean harbor if a contractor accidentally or deliberately breaches the capsule containing the toxic waste?	No work is proposed in or adjacent to the lined landfill area or other airfield areas where hazardous materials are stored.
224.4	Water Quality	Monitoring	...What will the construction of the proposed runway do to this so-called concealed/protective hazardous waste?	Massport recently completed a soil boring and chemical analytical program along the centerlines of Runway 14/32 and the Centerfield Taxiway. The preliminary soil chemical data indicate that the large majority of soil to be excavated is not regulated soil in that it did not exceed the S-2 Reportable Concentration. Therefore, this excavate may be recycled at in-state or out-of-state lined landfills or used at industrial sites for fill. In accordance with Massport's Soil Management Plan, the excavate will not be used for fill or any other use at environmentally sensitive sites such as near wetlands, playgrounds, water supplies, etc.
224.5	Construction	Mitigation	What will happen to the air, the water, the soil not only in East Boston but all along the waterways? ...	Monitoring of airborne soot levels in the vicinity of Logan Airport have shown that the airport is a very small (less than one percent) contributor to ambient levels. In addition, Nitrogen Oxides emissions associated with the Airside Project are lower, when compared to the No Action Alternative. Construction and operational controls will be implemented to ensure that any potential impacts to natural resources are minimized. In general, these will include a construction soil erosion and sediment control plan, a stormwater management plan and the use of Best Management Practices (BMPs) for daily airfield operations.
224.6	Airport Operations	Safety	As the percentage of flights increase over homes, and communities, we need to have some questions answered! We also must prevent catastrophic conflagrations, the potential of which increases with each new plane and flight pattern added to a sky already supersaturated with all types and sizes of aircraft...[Within the last five years] ■ how many flights leaving Logan have been aborted due to: ■ faulty equipment? ■ smoke in the cockpit or cabin? ■ How many near misses of planes flying over New England? ■ How many flights, not from Logan, have had to make emergency landings? ■ How many incidents of unruly passengers in flight over New England? ■ How many disabled planes unscheduled on Logan's roster have had to land at Logan? ■ How many planes have gone off the runways? ■ How many planes approaching or leaving Logan have crashed?	The goals of the Airside Project are to reduce delay, increase airport efficiency, and reduce negative environmental impacts. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. Although safety is the first consideration of any proposed alternative at Logan Airport, this data were not relevant to the Airside Study. However, such questions can be answered by contacting the public affairs offices of the FAA or Massport.
224.7	Airport Operations	Safety	[What measures are being proposed to avoid catastrophes such as air collisions over East Boston or damage to fuel storage facilities near the airport? The increase flights proposed increases the potential for accidents, spills, and further degradation to the local environment.]	The first goal of the FAA and Massport is always to provide safe air transportation. Logan Airport has a tightly controlled system of flight tracks and procedures to prevent aircraft accidents. Runway 14/32 and the other proposed Airside improvements are designed to enhance safety and efficiency of traffic operations in the air and on the ground. The runway will segregate smaller aircraft and reduce congestion during northwest wind conditions, reducing the possibility of mistakes and potential for accidents. The Airside Project will not increase flights at Logan Airport. They do not increase the capacity of the airport, but allow the handle the future traffic with enhanced safety and efficiency.

Code	Topic 1	Topic 2	Comment	Response
224.8	Ecosystems	Wetlands	...How can we protect the wildlife? How can we provide opportunities for outdoor education? What would a new runway do to our natural environment and rich resources?	The Airfield Improvements that comprise the Preferred Alternative will be constructed within the confines of the existing airfield. Most of the wildlife that occurs on the airfield will continue to do so. For the only state-listed endangered species that occurs on the airfield, Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The Airfield Improvements will not affect existing opportunities for outdoor education. Section 6.5 of the Supplemental DEIS/FEIR documents that with the exception of the Sandpiper, the Preferred Alternative will not impact natural resources.
224.9	Ground Transportation	Access to Logan	[There is already insufficient infrastructure to support the existing volume of traffic going to and from the airports. The proposed expansion will increase these problems.]	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
224.10	Ground Transportation	Access to Logan	[Route 1A must be depressed to reconnect East Boston with Bell Circle, and something must be done to avoid the constant gridlock that will result from more vehicles approaching Logan.]	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways.
224.11	Ground Transportation	Access to Logan	A special truck route should be constructed to keep [traffic] off our neighborhood streets!	The Airside Project does not result in additional demand for ground access services.
224.12	Airport Operations	Safety	[Emergency drills should be conducted and include neighboring towns such as Chelsea, East Boston and Revere.]	The first goal of the FAA and Massport is always to provide safe air transportation. Runway 14/32 and the other proposed Airside improvements are designed to enhance safety and efficiency of traffic operations in the air and on the ground. Massport does conduct periodic emergency drills that involve appropriate personnel of neighboring towns.
224.13	Ground Transportation	Access to Logan	[Stronger enforcement is needed to keep large trucks off those city streets with weight restrictions.]	Comment noted.
224.14	Ground Transportation	Access to Logan	[Stronger measures are needed to keep airport traffic off city streets during busy periods.]	The Airside Project does not result in additional demand for ground access services.
224.15	Ground Transportation	Access to Logan	[Massport must encourage public transportation.]	The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's progress on meeting its air passenger goal of 35.2 percent by the time air passenger volumes reach 37.5 million annual passengers. Consideration will be given to ways to enhance transit ridership and use of the Logan Express bus service. In addition, Massport is considering consolidation of car rental facilities, which will facilitate the consolidation of the courtesy vehicles serving the rental car companies.
224.16	Ground Transportation	Access to Logan	[Massport needs to discourage use of local streets as temporary storage for limousines and trucks associated with airport-related businesses.]	Comment noted.
224.17	Open Space/ Parkland	Mitigation	[Massport must return or replace the loss of Amerina Park and Amerina Field lost during uncontrolled airport expansion.]	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
224.18	Noise	Impacts	[Massport and the FAA need to enforce noise standards better and force the airlines to make their planes quieter.]	The noise impact per operation is expected to diminish in the future for several reasons. The two largest airlines at Logan Airport, Delta Air Lines and US Airways are replacing their hushkitted shuttle fleets with full Stage 3 aircraft. US Airways took delivery of Airbus 320 aircraft in the fall of 1999 and Delta Air Lines has ordered Stage 3 Boeing 737-800s for its Boston to New York shuttle operations. By the end of 2000, approximately 24,000 annual operations were replaced by full Stage 3 technology aircraft.
224.19	Open Space/ Parkland	Mitigation	[Massport should provide open space and parkland in East Boston to replace lost parkland from previous Logan expansions.]	The Preferred Alternative will neither incorporate land from nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site.
224.20	Alternatives	Runway 14/32	[A new runway can only exacerbate existing problems in the community caused by Logan-related traffic and operations.]	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Annual Updates (Environmental Data Reports).
224.21	Public Health	Effects	[The health and safety of the community needs to be the "first and foremost" consideration in discussing plans to expand Logan.]	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study*. Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.
224.22	Alternatives	Other Non-Construction Alternatives	[Existing flight patterns need to be changed to reduce impacts on communities. The noise, odor, vibration and pollution impacts on the community are unbearable and will only get worse.]	The existing flight tracks at Logan Airport have been developed over a long period of time with community consultation and provide the best combination meeting both airport requirements and community needs. The redesign of existing flight tracks was not included as a part of the Airside Project. The only new tracks proposed in the Airside Project Draft EIS/EIR are for Runway 14/32 and are over water.
224.23	Open Space/ Parkland	Mitigation	It is time for relief and the return/replacement of open green space and developed parkland not a further exacerbation of 1,300-plus rent-a-cars and other negative impacts in our backyards.	Comment noted.
224.24	Public Health	Effects	[What are the health effects of all the pollution dumped on East Boston as a result of airport operations?] [Why does East Boston have such high incidence of high blood pressure, cancer, chronic lung disease and asthma?] [What are the increased health impacts associated with the proposed 21,000 flights?]	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study*. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR.
224.25	Environmental Justice	Demographic Data	[As far back as 20 years ago a second airport was recommended in Dover, Massachusetts. This site was rejected immediately because Dover is a wealthy community, yet East Boston continues to suffer greater pollution and airport expansion.]	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions.

LETTER 225

April 22, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. **#10458**
100 Cambridge Street - 20th Floor
Boston, MA 02202

Dear Secretary Durand,

As introduction, be advised that I am a East Boston resident and home owner. My experiences of living with the impact of a local airfield, which has grown to major international air transportation facility, so close to the city, have spanned a generation. With resources and knowledge typically available to one person, this letter will document the past, present, and future empirical environmental impacts exerted by airport operations, as well as the immeasurable impacts of those operations.

While reading the Draft Logan Airside Improvement Plan Environmental Impact Report, EOEA #10458 ("EIS/EIR"), it becomes obvious that a resident, citizen, a local business group or a small activist organization each to their own devices or as a cohesive group, can not begin to participate in a fair process, with the intentions of changing the sponsor's desired result and attain that goal. The resources necessary to adequately address, comment on, disprove or rebut the report details and conclusions, even within the extended time allotted, are far beyond an individual's reach. When the opponent has the process "wired", as appears to be the case in this instance, even a technically based cogent document comment is discounted by reference to a study which may be based on flawed data. The sponsor makes abundant use of consultant reports, the results of which may be forgone conclusions.

Problem

Logan, as configured, is beyond demand capacity both airside and landside. The proponent seeks to address the long range, eastern Massachusetts, all mode transportation demand and capacity problem through the proposals contained within this EIS/EIR.

The problem scope is wider than that which is addressed within the EIS/EIR, however, the proponent seeks to frame the problem as limited in scope, under the banner "Reducing Delays at Logan".

The alternatives are limited in scope to just the Logan airport airside aspects of a region wide transportation issue. Logan airport is overextended, and if the delay figures are to be believed, it can not meet the demand of the next century under any modification proposals.

Root Causes

Within the EIS/EIR limited scope context, the problem root causes are:

#1 As a coastal airport wind and weather are the most significant factors contributing to delays at Logan.

#2 Peak Period demand due to fleet mix and a high level of regional carrier flights operated with smaller aircraft.

#3 Demand imposed by airline flight schedules.

In summary, the proponent's Preferred Alternative 1A package does not eliminate the problem root cause but merely addresses the effects of root cause #1 and #3, both of which are outside the proponents sphere of control. In not seeking a root cause solution, at a different, larger and appropriate geographical setting, thereby ELIMINATING root cause #1 and #3, the proposals will result in a short term reduction of effects. In addition, the Preferred Alternative 1A ignores the only short term remedy, reducing demand administratively through Peak Period Pricing, which would not impose further environmental and safety impacts on and beyond the airside island. 225.1

The Preferred Alternative 1A, if the source data is accurate, predicts reduced delays as the result. Just as the high/low load data may overstate delays in may understate them as well. The Preferred Alternative 1A, short term remedy goal to reduce delays, will not solve the problem root cause and eliminate delays. The Preferred Alternative 1A assumptions also predict minimum or no induced passenger loads resulting from increased operations.

For these reasons Alternative 1 and the Preferred Alternative 1A should be found to be inadequate and only Alternative 3 should be considered a remedy, to effect the stop gap demand reductions the sponsor is seeking.

Data

The data and modeling throughout the EIS/EIR is questionable. The data baseline years used for data classes such as noise contours, delayism, passenger volume and growth, operation volume and growth among others, establishing the base for comparison and projections differ. The sponsor uses 1993 as a base line for aircraft load factors. 1993 was the year during which the loads were very high due mainly higher demand and airline over-scheduling, it is not representative of the modeling succeeding years. Decisions should be delayed until results of the upcoming 1998 GEIR are reviewed to confirm the modeling technique is accurate. Use the most recent data for forward projection and establish 1998 as the base line. 225.2

The sponsor uses an extrapolated trend line through the 1993 baseline year to forecast 1999 & 2010 fleet operation projections. The trend was flat during 1994 - 1997 rather than increasing at the average rate. The load forecasts were developed in 1994 and 1995 and ignore the actual data during the subsequent years.

One example of inaccurate data is the modeling projections use *scheduled operations (515,822)* rather than actual operations during 1993 (493,093) or 3.4% fewer actual operations.

Delayism Modeling

The sponsor relies heavily on the DELAYISM model and algorithms to substantiate the problem. As reported in the 1994/1995 GEIR, the modeling, constants and algorithms used to compose the NEM contours were flawed, but it is that very data which was used at that time to make noise contour projections into 1999, and eliminate homes for mitigation eligibility. (The subsequent annual updates supposedly adjusts the error to compensate for the 3 to 7 db Ldn underestimate of ground roll effects). 225.3

The DELAYISM model must be proven over a considerably longer time period and the model compared to empirical data, before the sponsor is allowed to rely on it to define the problem and be accepted as proof. As likely as the model may overstate delays in may understate delays and the sponsor has overestimated the proposed Alternative effect to solve the delay problem through the next century.

Seat Departure Metric

The proponent makes abundant use of OAG data to frame the delay problem. The problem is measured in terms of operations and operation delays. It further models those operation delays in the context of passenger delays, using a seat departure metric as a passenger delay measurement. The passenger delay is then equated to a cost of delay. 225.3

The seat departure metric is only an accurate measurement, when supported by data indicating the number of seat departures with passengers in them. Without that data, an accurate measurement of passenger delays and cost can not be made. To assume each seat departure delay is a passenger delay, using carrier reported load factors for every operation, severely overstates the cost of delay. The GEIR annual updates revises the reported seat departures, but those adjustments are not used in the EIS/EIR conclusions. (cont.)

Therefore, the EIS/EIR delay cost foundation, its conclusions, remedies and impacts are not supported by current data and is inadequate.

Runway Length

There is insufficient land area west to east along the 14/32 heading to construct a 5000' runway. The 5000' active runway length plus the FAA standard 1000' runway safety area ("RSA") on each end exceeds the undeveloped land area length. To build, it would impose more impacts than addressed in the EIS/EIR. 225.4

The additional impacts are:

- Option A - Acquiring more land area in addition to the #60-61 cargo buildings, such as the parking area for the Hyatt hotel, to gain length to the west.
- Option B - Filling in the harbor on the east end or building a ramp structure into the harbor to gain length to the east.
- Option C - Compromising FAA safety standards by reducing the RSA to less than 1000' on one or both ends.

In choosing Option C, the EIS/EIR is inadequate in addressing this issue. The examples sited for aircraft incidents and how they relate to runway centerline and reduced RSA are ludicrous. The citing can not be accepted as a tacit FAA approval or likely approval of Option C.

The proponent brought forward the 5000' active runway length in favor of 4500', to accommodate a larger jet fleet using the 32 end for landings. There is insufficient land area to build any more than a 4000' to 4500' runway.

I ask that you find the EIS/EIR inadequate regarding this critical issue with the following remedies:

- At minimum, the proponent must have a final acceptance document, with impact analysis, from the FAA regarding a below minimum RSA waiver, under Option C.
- Absent the FAA approval, the proponent revise the EIS/EIR to demonstrate how the 5000' runway would be accommodated . That modified EIS/EIR, with impacts analysis due to harbor intrusion to the east or land acquisition to the west, be evaluated on its merits.
- The proponent modify the EIS/EIR proposal Alternatives 1 and Preferred Alternative 1A and substitute the build with a 4000' to 4500' runway. That modified EIS/EIR, then must be evaluated as to whether it meets the stated goal of reduced delays.

Regional Agreements

The sponsor has stated; No agreements are in place which would bind either the airport operators or the carriers to induce or encourage operations to and from Worcester, Providence, Manchester or Hanscom. Any shift in passenger demand would occur over a long time period, and would be largely dependent upon air carrier decisions relative to service levels, destinations and fares. In the Preferred Alternative 1A and Alternative 1, the sponsor is highly dependent upon operations moving from Logan to these other airports. The sponsor argues, reduced delays at Logan will encourage travel from the regional airports is specious. Only the No-Action Alternative and Alternative 3 (no-build), as a result of the forecast increased delays, will induce an operation shift to the regional airports. 225.5

The regional passenger load reduction conclusions in Preferred Alternative 1A and Alternative 1, should not be considered a factor in meeting the short term or long term problem root cause solution. With no agreements in place and a build scenario, passenger volume will be induced at Logan. Carriers are not motivated to create regional markets. The predictor of this is 1993, when operation capacity overload was experienced due to over-scheduling. Carriers will maximize operations in the active market up to the operation volume capacity and beyond.

The sponsor indicates demand imposed by airline flight schedules as a potential problem tertiary root cause, and infers it is a situation beyond its control. " If operating conditions change and the environment at Logan becomes more like 1993, then over scheduling may once again become a significant cause of delay at Logan....".

EIS/EIR Scope

Consistently, through the ENF and the EIS/EIR, the sponsor has ignored the mandate for a broad scope EIS/EIR. The sponsor prefers to interpret the Federal and State scoping documents to limit the EIS/EIR scope to only air side improvements. Further improvements to Logan will induce more land side traffic volume and overload the capacity of and already fragile land transportation system.

Even supporters of the Preferred Alternative point to the land side delays as a detractor to using Logan.

The sponsor's Preferred Alternative 1A expansion to reduce delays and provide for more operations, encourages and induces more passenger visits and thereby more land side impacts.

The demand for air travel to, from and through Logan is a function of economic trade forces beyond the sponsor's control.

The sponsor has very limited control over aircraft operations. No restrictions may arbitrarily be put in place to limit who uses the airport and when. Those limitations are beyond the control of the sponsor. The desired effect of reduced delays, if it is accomplished, will be manifested in more induced operations and thereby more land side impact.

There has been an increased number of public parking spaces on site and the relocation of employee parking to Chelsea. This effort is not a mitigation of air quality issues, it merely relocates the emissions to a location outside the scope of the EIR. No EIS/EIR has been done to measure the effects at the off-airport locations.

The EIS/EIR should be judged inadequate until the scope is expanded to consider all concurrent land side projects, and the impacts on the surrounding community. 225.6

Second Airport

This point is not a direct argument to a specific impact within the EIS/EIR, but it addresses the overall limited scope theme the sponsor has chosen. The argument demonstrates the EIS/EIR inadequacy, in not addressing the problem root cause and limiting the EIS/EIR scope.

The long range solution to the delay problem root cause (coastal airfield with insufficient land space) is a second major airport. The proponent, in response to numerous comments to the ENF, contends:

"A second major airport is not a solution to the current delay and congestion at Logan...."

While that response may be accurate, the key word to consider is "current". The proponent implies the Preferred Alternative solution is a short term, stop gap measure, and irresponsibly ignores the regional transportation problem, both airside and land side, that in fact would be solved by a second major airport. 225.7

The statewide evaluation of appropriate airport sites conducted in the early 1990's evaluated approximately 188 potential sites, from which all but one site were found to be inadequate for a second major airport. The one site evaluated as having all the attributes, was Fort Devens in Ayer MA. The proponent has stalled and delayed the long overdue decision to support a second major airport and in the process have lost at least 7 years of development and construction time. The proponent has been irresponsible by allowing the Logan problem to grow to crisis stage, and use its inaction and the crisis as a backdrop to argue for a poorly planned, hastily conceived, short sighted, inadequate, short term solution to an immense problem.

Just as the proponent contends doing an analysis is not a guarantee that action will be taken on a proposal, an analysis of Fort Devens as a site for a second major airport should be done. It is understood that legislative action is required to acquire that or any site but it should not be a barrier to the analysis. The proponent may already have conducted such an analysis, but chose to take the path of least resistance, rather than solve the problem, in pursuing the second airport.

It is incumbent upon the sponsor, under its charter, not encourage operations outside of eastern Massachusetts, along with the growth and revenue, but actively pursue the second Massachusetts airport long term solution. The paradigm, 15 years of planning is too long to wait therefore do not begin the process, is easily overcome by focusing all the Authority's resources to such a plan. There are many knowledigble activists in Boston to aid that effort. 225.8

Hanscom Field is classified by the FAA as a reliever airport, but provides merely general aviation relief. In 1997 Hanscom handled 188,000 operations, 85% of which (160,000) were single engine piston aircraft.

Massport has not demonstrated vision and planning in its utilization of Hanscom to relieve Logan's delay problems. It is beyond its control, ability or desire to develop passenger service at Hanscom. Currently, there are no carriers providing scheduled passenger service to or from Hanscom, regardless of this fact, the sponsor uses Hanscom as a regional capacity reliever in both Preferred Alternative 1A and Alternative 1.

Hanscom AFB even at 1000 acres is sizable. As a property owned by Massport, the eminent domain process is available to expand that land area and truly share airport impacts at a different socio-economic level. However it chooses the more expedient course through Logan expansion, rather than confront the NIMBY opposition at Hanscom or Ft. Devens.

Ceiling Reductions

The proponent again demonstrates irresponsibility bringing forward reduced minima within this EIS/EIR. The DH and DA reductions are in direct conflict with agreements in place with the FAA and the reduction proposal seeks to disregard the process to change them. 225.9

Runways 22L and 27 both use a Category I instrument landing system ("ILS"), with specific ceiling minimums, DH and DA for approach and landing. Due to the unique characteristics of Logan and its proximity to residential areas, the FAA chose, demonstrating good judgment, to retain the existing approach minimums.

Centerfield Taxiway

The taxiway stated intention is to alleviate congestion by moving aircraft to and from the gates more efficiently. It would clearly accomplish that goal by allowing multiple simultaneous runway 4/22 crossings. However due to the close proximity of residents to the northeast runway ends, the prevailing winds when these runways are in use will carry the increased V.O.C., Co, NOx emissions into residential areas, when aircraft are queued on the taxiway. This taxiway, if allowed to queue the maximum aircraft as space permits, would result in more aircraft using the taxiway under power, rather than being at a gate, not under power, waiting to queue.. Clearly, the end result will be cumulatively more noise, NOx and Co emmisions, from those queued aircraft operating under low pressure low power conditions.

What is the limit of planes allowed to queue on this taxiway? The center taxiway without limitations, impacts the environmental air quality in the surrounding residential areas. 225.10

Public Health Assessment

The costs related to early deaths and adverse physical conditions to people living in close proximity to the high noise contours has not been effectively measured. Logan's 225.11

noise effects have been present without mitigation from the time the facility transitioned from propeller and prop-jet aircraft through to stage I & II aircraft.

There is a long range, approximately 10 year, clinical study which began in the 1970's conducted by Dr. Taylor of the East Boston Health Center. The study focused on hyper-tension within the community and causative factors.

The scope of the EIR should be expanded to correlate the results of that study within the context of the earliest noise contours. Additionally, the INM should be used to chronologically reverse model NEM contours using data from specific stage I and stage II aircraft, operational data, the most current ground roll adjustments and other INM inputs which were valid during the period of the hyper-tension study. The data from the hypertension study should be correlated geographically and then overlaid with the modeled contours from that period. It is assumed, and an actual study will reveal, that the incidence of hyper-tension, hearing loss, interrupted sleep patterns, stress, and the inherent ill effects, will geographically coincide with the highest level modeled NEM contours. The evaluation should, at minimum document the incidence of hyper-tension within the 75, 70, 65 and 60 Ldn contours. 225.12

The results will provide data to evaluate the cost of premature death, ill-health, medical treatment, psychological and social dysfunction.

Noise

The noise level from both over flights and especially ground noise from takeoffs is insidious, continuos and far exceeds noise levels applicable under RSIP. The noise levels are so severe they are manifested in both measurable audible levels far exceeding both the RSIP time weighted average threshold and especially the short term excursion limit, and as physical resonant frequency modes matching the structural modes of my home as well as other homes built under the same codes. The noise level and resulting resonant vibration during takeoffs from runway 22 are so high that they fall into the unsafe category for very short time periods under federal OSHA standards for safe working environments, and by inference are unsafe for residential environments. 225.13

In classifying jet operations, Massport classifies Stage 2 aircraft fitted with hush kits as Stage 3 aircraft. Stage 3 aircraft exhibit similar noise and pressure in the <100 hz and "C" weighted ranges as Stage 2 aircraft. Any measurements and modeling, for low frequency noise, should assume operations as being Stage 2 aircraft. The 1994/1995 GEIR noise analysis uses only Stage 3 noise data for these fitted aircraft. 225.14

Mitigation is nearly impossible for these low frequencies, and results in resonance effects inducing vibration in the majority of residences, located in the 65 to 75 Ldn contours, built with light weight wall structures.

The noise levels from aircraft is but one intrusion affecting the quality of life in the surrounding communities. There are additional major inconveniences resulting from ground traffic on local streets and highways due to airport related loads, during peak travel periods. Not readily recognized but more intrusive, is commercial vehicular traffic inherently more noise producing than passenger traffic, serving airport support businesses, which occurs during distinctly off peak hours during both the early morning and late evening.

Support

The Preferred Alternative 1A supporters are on record as having a special interest related to their business or their personal wealth. Indeed, they do have a voice in the process which should be heard, but their disregard for environmental impacts and the evaluation bias based strictly on money, must be weighed against the human impacts. As Secretary, I ask that you give greater weight to factors unrelated to business costs. Answer, how much is a life worth? Then answer, how much is a life worth if it were yours or your family? There should not be a distinction. The direct, indirect and cumulative environmental impacts imparted through Logan operations, cost lives which must not be sacrificed for business growth.

The injunction

The sponsor has expended money performing an ENF and an EIS/EIR for approval of a plan which is precluded by a court injunction in place since 1974, prohibiting further airport expansion through added runways. The EIS/EIR adequacy is a pre-requisite to arguing for its removal.

The injunction was fought for an won during period in which, political will was the primary vehicle for change. The abutters and the community did not have the current Federal and State Code of Regulations nor the teeth of the present Federal and State Environmental Protection Agencies to provide opposition support. The fact that the injunction has stood the test of time and has been respected by political administrations for nearly a generation, is a testament in itself to the conviction and the wisdom of both political party state leaders. They realized that expansion at Logan was not, is not and will not, solve the root cause of the eastern Massachusetts transportation problems.

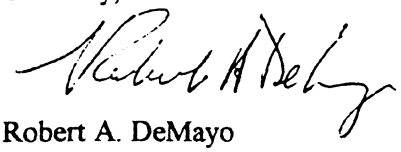
The sponsor and its administration demonstrates lack of responsibility and poor judgment, putting forth a stop gap solution to a major problem. It also demonstrates a lack of respect for the community. Yet the sponsor has dragged its feet in its application of

mitigation through sound proofing and other means while it is hurtling headlong into a short sighted, ill-conceived expansion plan.

Some of these are emotional type issues, but you must consider what is the correct decision in terms of human factors as well. To the decision makers, it is just a job or a political appointment from which they will succeed to other noble causes. Left in the wake of poor decisions are thousands of people, whose quality of life are irreparably damaged. Step into the shoes of a member of the largely immigrant population, who have inherent socio-economic problems. Walk the walk of the dis-enfranchised, to whom life style choices are limited and are in direct proportion to their near minimum wage, and deciding where to live is a distant option never considered.

These are among the many reasons the EIS/EIR should be found to be in adequate as it is presently composed. A finding of inadequacy will force the debate to consider a eastern Massachusetts transportation long range solution.

Sincerely,



Robert A. DeMayo

Code	Topic 1	Topic 2	Comment	Response
225.1	Regional Transportation	Regional Airports	Within the EIS/EIR limited scope context, the problem root causes are: #1 As a coastal airport, wind and weather are the most significant factors contributing to delays at Logan. #2 Peak period demand due to fleet mix and a high level of regional carrier flights operated with smaller aircraft. #3 Demand imposed by airline flight schedules. ...the proponent's Preferred Alternative 1A package does not eliminate the problem root cause but merely addresses the effects of root cause #1 and #3, both of which are outside the proponent's sphere of control. In not seeking a root cause solution, at a different, larger and appropriate geographical setting, thereby ELIMINATING root cause #1 and #3, the proposals will result in a short-term reduction of effects. ...The Preferred Alternative 1A, short-term remedy goal to reduce delays, will not solve the problem root cause and eliminate delays. ...	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size. Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields. Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
225.2	Analysis Assumptions/ Methodologies	Base Year	... The data baseline years used for data classes ... establishing the base for comparison and projections differ. ...	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative.
225.3	Delay	Model	... As reported in the 1994/1995 GEIR, the modeling constants and algorithms used to compose the NEM contours were flawed, but it is that very data which was used at that time to make noise contour projections into 1999, and eliminate homes for mitigation eligibility. ... The DELAYSIM model must be proven over a considerably longer time period and the model compared to empirical data, before the sponsor is allowed to rely on it to define the problem and be accepted as proof. ... The seat departure metric is only an accurate measurement, when supported by data indicating the number of seat departures with passengers in them. Without that data, an accurate measurement of passenger delays and cost cannot be made. ...	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32,. reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport. All models are recognized by the FAA and have been used in prior studies funded by the FAA. The forecasts developed for the future scenarios included estimates of passengers, seats, load factors, and operations, so estimates of the delays to passengers and their associated costs consider the number of seat departures with passengers (the load factor).

Code	Topic 1	Topic 2	Comment	Response
225.4	Alternatives	Runway 14/32	There is insufficient land area west to east along the 14/32 heading to construct a 5,000-foot runway. The 5,000-foot active runway length plus the FAA standard 1,000-foot runway safety area ("RSA") on each end exceeds the undeveloped land area length. To build, it would impose more impacts than addressed in the EIS/EIR.	Runway 14/32 would not impact land areas off of the existing airfield. A Determination of Acceptance of the Level of Safety will be sought from the FAA for the two small, triangular corners of the Runway 32 end RSA and the portion of the RSA south of the runway, which lie over water.
225.5	Regional Transportation	Regional Airports	... The sponsor argues, reduced delays at Logan will encourage travel from the regional airports is specious. Only the No-Action Alternative and Alternative 3 (no-build), as a result of the forecast increased delays, will induce an operation shift to the regional airports. ...With no agreement in place and a build scenario, passenger volume will be induced at Logan. Carriers are not motivated to create regional markets.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
225.6	Environmental Review Process	FAA/NEPA, MEPA	The EIS/EIR should be judged inadequate until the scope is expanded to consider all concurrent land side projects, and the impacts on the surrounding community [including the potential for increased traffic and air quality impacts in areas currently outside the sponsor's self-determined study area].	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project has independent utility from existing and proposed landside projects at Logan Airport. The proposed Airside Projects at Logan Airport are designed to improve airport efficiency and better accommodate current and future levels of demand. Long-term growth in air travel demand is a recognized worldwide phenomenon that results from economic and demographic growth. Massport has no control over the underlying determinants of aviation growth. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway will not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year. The runway does not induce or stimulate new traffic that would otherwise not occur at Logan Airport. Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent and its subsequent Environmental Data Reports (Annual Updates). No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

Code	Topic 1	Topic 2	Comment	Response
225.7	Regional Transportation	Regional Airports	....The proponent implies the Preferred Alternative solution is a short-term, stop gap measure, and irresponsibly ignores the regional transportation problem, both airside and land side, that in fact would be solved by a second major airport.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years.
225.8	Regional Transportation	Regional Airports	It is incumbent upon the sponsor, under its charter, not encourage operations outside of eastern Massachusetts, along with the growth and revenue, but actively pursue the second Massachusetts airport long term solution.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.
225.9	Alternatives	Reduced Approach Minima	The proponent again demonstrates irresponsibility bringing forward reduced minima within this EIS/EIR. The DH and DA reductions are in direct conflict with agreements in place with the FAA and the reduction proposal seeks to disregard the process to change them.	The agreement between the City of Boston, the FAA and Massport stipulates that any modification of the existing minimums requires completion of an EIS/EIR, even though the setting of minimums is otherwise categorically excluded from the EIS/EIR process. The reduced minimums will, in fact, enhance safety by providing precision guidance to a point closer to touchdown and reducing reliance on Runway 4R under poor weather conditions, when winds may favor use of an alternate runway.
225.10	Alternatives	Taxiway Improvements	[The proposed taxiway would increase pollutants being blown into residential areas.] What is the limit of planes allowed to queue on this taxiway? The center taxiway, without limitations, impacts the environmental air quality in the surrounding residential areas.	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

Code	Topic 1	Topic 2	Comment	Response
225.11	Public Health	Effects	The costs related to early deaths and adverse physical conditions to people living in close proximity to the high noise contours has not been effectively measured. ...	Noise was identified as the only off-airport impact associated with the Preferred Alternative (refer to Section 6.2 of the Supplemental DEIS/FEIR for a discussion on noise impacts). Environmental and health studies relating to the City of Chelsea were reviewed to assess the potential for other cumulative or multiple adverse exposures, since the increase in population within the 65 dB DNL contour associated with the Preferred Alternative is primarily within this community. A review of issues within Chelsea indicated a concern regarding toxic discharges associated with industrial facilities, truck emissions, and contamination of Chelsea Creek. There was nothing to suggest that these issues increased the noise impacts associated with the Preferred Alternative. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. Refer to Section 6.8 of the Supplemental DEIS/FEIR for additional information.
225.12	Environmental Review Process	MEPA	The scope of the EIR should be expanded to correlate the results of [the "Taylor study of the East Boston Health Center"] study within the context of the earliest noise contours. ...	The Scope of Work for the Supplemental DEIS/ FEIR was defined by the FAA and MEPA following an initial scoping process. A subsequent set of tasks was developed after a follow-up review of the Draft document by the Supplemental DEIS Panel empowered by the FAA to add supplemental information to the Supplemental DEIS. Neither scope included mention of the "Taylor Study".
225.13	Noise	Impacts	...The noise level and resulting resonant vibration during takeoffs from runway 22 are so high that they fall into the unsafe category for very short time periods under federal OSHA standards for safe working environments, and by inference are unsafe for residential environments.	OSHA standards are not applicable to community noise. Nevertheless, the baseline standard for workers is a maximum exposure of 90 dBA *continuously* for 8 hours per day, with higher levels up to 120 dBA permitted over shorter durations. As indicated in the tables of data listing Times-Above-Threshold sound levels (e.g. Table E-4 of the Supplemental DEIS/FEIR showing results for the High Regional Jet scenarios), the highest duration exposure to levels of 85 dBA (5 dB more conservative than OSHA) occur at Site 4 in Winthrop where the total duration of the exposure over a full 24-hour period is only 14.4 minutes. Exposure above 90 dBA OSHA standard is obviously less than that and is well below the allowable 8 continuous hours. The noise levels occurring in even the closest community do not come close to exceeding OSHA standards.
225.14	Noise	Impacts	Mitigation is nearly impossible for these low frequencies [<100 Hz), and results in resonance effects inducing vibration in the majority of residences, located in the 65 to 75 Ldn contours, built with lightweight wall structures.	Neither Massport nor the FAA is aware of any evidence to support the contention that structural damage has ever occurred due to overflights. Noise-induced vibration levels from aircraft, though they may cause rattling, are normally less than footfalls produced by people walking through their own homes.

LETTER 226

Mary Dreitlein
408 Summer Street
East Boston, MA 02128

March 3, 1999

Secretary Robert Durand
c/o MEPA
100 Cambridge Street
Boston, MA 02202

Dear Secretary Durand:

I am writing to express my concerns over Massport's proposed runway 14/32. Logan cannot handle the air traffic growth of the 21st Century. The present noise inside the city has rendered many areas unfit to live in. Logan is calling this new runway a "delay reduction program", call it what you may, it is an expansion of Logan Airport, an expansion of the noise pollution and air pollution, not just from the planes, but from the increased auto traffic, bound to be moving inefficiently to and from Logan.

Logan is here in East Boston, it will not go away, it can serve the city well, but to do so it must reduce it's size. It is beyond capacity now! Another airport is needed. The dollars already spent by Peter Blute to promote this plan could have and should have been spent developing a rapid rail system between Hanscom and Boston. Much of what makes Boston a wonderful city to visit as well as to live in is being damaged by Logan.

As one that lives close to the airport, not on a flight path, I can tell you that there is still constant noise. If "Massport windows" were installed in every home in Boston that may provide some relief on cold winter days. What of the beautiful spring, summer, and fall days. Are we to sit in a tightly closed home with no fresh air? Is that what life in Boston is to become? 226.1

Peter Blute says the increased planes will come with or without the new runway. What would he do if he were the CFO of a hotel? Put beds in the halls, when that was full, tap on the doors of sleeping gusts to tell them they must add a cot or two in their room. Capacity is capacity! If the airport is full, if the "NO VACANCY" sign is on the plans will go elsewhere. Hanscom and T.F. Green are reasonable alternatives. Boston cannot take any increase in air traffic, we must work to reduce the size of Logan so it can serve Boston as it should!

This is a difficult problem at best. The points I have made are but a few, to sight all of the reasons why Logan should reduce it's volume would take more time than is reasonable. Please consider what has been said here. I am only one of the million people that live in and love Boston. Protect the environment of Boston.

Sincerely,

Mary Dreitlein

Ms. Mary Dreitlein

Code	Topic 1	Topic 2	Comment	Response
226.1	Regional Transportation	Regional Airports	[Logan is already beyond its operational capacity. Massport should explore Hanscom as an alternative to further expansion at Logan.]	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.

LETTER 227

Mary Dreitlein
408 Sumner Street
East Boston, MA 02128

Mr. Robert Durand
Secretary of the Executive Office of Environmental Affairs
100 Cambridge Street, Room 2000
Boston, MA 02202

April 11, 1999

Dear Mr. Durand:

Protecting the environment is perhaps the most important job anyone can have. Your organization will soon face a major decision which will effect not just our generation, but many generation in the future. Massport's desire to expand Logan Airport is wrong. It will bring increased pollution to our city. It is time to force Massport to find alternative solutions.

I have attended almost all of the public meetings regarding runway 14/32, and although it has been packaged with the title of "Delay Reduction" even Massport officials admit that it is an expansion of Logan. Those that support this expansion do so in the name of money. They do not speak of the environment, of the increased noise and air pollution. How sad it is to hear Massport even speak of having to move birds to Cape Cod because of the increased noise pollution they will cause, and say it will help the economy.

It is all a balance. Being in the city has it's advantages and it's disadvantages. East Boston has accepted Logan. We have had to keep a constant watch on them in order to maintain an acceptable quality of life. Each year the problem has increased. Having an airport right in the heart of the city is an advantage to everyone. If Logan were down sized to where it was ten years ago everyone would reap benefits. The plans would land on time, and the passengers would be able to get from Logan to their final destination, which I may add is usually the most difficult part of anyone's trip. 227.1

Enough has already been pointed out regarding Logan's Environmental Impact Study to be able to say for sure that it is a flawed document. It is a fact that outdated figures were used. It is a fact that the FAA modeling was not adhered to. It is a fact that there has been a lack of alternative studies. It is also a fact that Massport will not reveal it's ten or fifteen year plan. 227.2

When Massport officials speak of the rapid rail system to T. F. Green Airport in Rhode Island, they do not mention the proposed fair for this rail service is twenty-four dollars one way. Nor do the discuss the proposed schedule.

There is no reason why Logan can not have a curfew. Other inner city airports do. There is no reason why Hanscom can not take the small jets, and prop plains, freight should not be going in and out of Logan. Logan can best serve Boston and the surrounding communities by moving people not freight. 227.3

Several years ago I spent two years in South Dakota working with the Lakota Sioux's. I would like to share some wisdom I learned from the true natives of our country. "When we make a decision we are responsible for seven generations." The effects of your decision will be either the pains or pleasures of the generations to come. Protect our city, protect our air, protect the generations yet to come as well as those of us that are here now. Clean air is more important than money. Please make your decision carefully. It is your job to protect the environment.

Sincerely,

Mary Dreitlein

Letter 227

Code	Topic 1	Topic 2	Comment	Response
227.1	Purpose and Need	Airfield Capacity	[Logan is operating beyond its capacity and should be downsized.]	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
227.2	Environmental Review Process	FAA/NEPA, MEPA	[The EIS/EIR used outdated figures to describe existing conditions and project future use.]	In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year.

Code	Topic 1	Topic 2	Comment	Response
227.3	Alternatives	Operational Restrictions	[Logan should have a curfew as other airports do. Freight and small planes should use Hanscom.]	A curfew is considered an airport access restriction. According to the "Noise Act", airport access restrictions are subject to FAA review and require completion of a FAR Part 161 Study. Since the Noise Act was enacted, the FAA has not approved any Part 161 access restrictions proposed by airport operators. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. In fact, 50 percent of passengers on Logan Airport commuter flights connect to other Logan Airport flights. The Secretary of Environmental Affairs' Certificate on the ENF directed Massport to "discuss [these] off-airport alternatives and analyze the potential each has to divert passengers and/or cargo from … Logan Airport." Cargo operations were not specifically analyzed because they account for only two percent of aircraft activity at Logan Airport and since most all cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport.

LETTER 228

Att: Robert Durand

I'm opposed to runway 14-32. I have been a resident of East B. for 64 years & I ha seen also my husband airport expansion & he's 7.

"Enough is Enough"

228.1 Please try to help find an alternate solution to this prob Any source of help would b greatly appreciated to all a residents of the surrounding areas.

Sincerely

228.1	Alternatives	Other Non-Construction Alternatives	[Please try to find an alternative solution to an expansion of Logan.]	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Dear Mr. Pugsley,

I am writing as part of the public comment on the issue of the environmental impact report filed by Massport. I believe that this report is inadequate and should be rejected. The report does not sufficiently address the impact of the new runway on the resident of the surrounding communities. Specifically, it does not address the health effects that increased flights will have on the residents of Eagle Hill neighborhood in East Boston. It also does not address the effect of these increased flights on the real estate value of property in this neighborhood. Finally, I believe that the rationale for building a new runway is misleading at worst, of flawed at best. Massport is using skewed figures....the chose 1993 a base year becuase it had the largest number of delays, and they down play the fact that delays have decreased since. Also, they have devised their own formula for calculating the number of delays, instead of using the formula established and used by the FAA. Finally, the new runway is only a stop gap measure iimpact on reducing delays will disappear in less than 10 years.

229.1

229.2

229.3

Again, I urge you to reject this report as inadequate and send Massport back to the drawing board to produce a plan for delay reduction based on a true regional airport system, landings slots and peak hour pricing.

Sincerely,

Robert Fleming

Code	Topic 1	Topic 2	Comment	Response
229.1	Public Health	Effects	... The [EIS/EIR] does not sufficiently address the impact of the new runway on the resident of the surrounding communities. Specifically, it does not address the health effects that increased flights will have on the residents [and] the effect of these increased flights on the real estate value of property in this neighborhood. ...	Comment noted.
229.2	Delay	Model	[Massport invented their own method for calculating impacts rather than using the FAA-approved method.]	All models are recognized by the FAA and have been used in prior studies funded by the FAA.
229.3	Alternatives	Runway 14/32	[The new runway is a stop gap measure at best and will only reduce delays for 10 years.]	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Re: Massachusetts Port Authority (MPA)
Logan Airside Improvements Planning Project ("Project")
Boston-Logan International Airport
Boston/Winthrop

Gentlemen:

I strongly request that the Massachusetts Secretary of Environmental Affairs, Secretary Durand, (the Secretary) and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed, that the document be found "INADEQUATE" and that a new Draft document be required. Each of the major three parts; the proposed runway 14/32, the centerfield taxiway between the 4/22 runways and, lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed. In addition, the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to 2020. 230.1

The proposed project is clearly major and complicated, having involving both air side and ground side implications. It is but a segment of a long term airport expansion plan.

I also want to go on record concerning the conflict of interest that exists for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. I request that the EPA take the lead role for this decision because of the conflict. 230.2

A comprehensive northeast regional transportation plan, including all forms of transportation, should be developed and put in place before any airport expansion is allowed. This should be accomplished with the cooperation of all interested parties, including, but not limited to, residents, businesses, and organizations. It should also analyze all impacts, including airside and landside at airports, track 230.3

adjacent properties for rail, any new planned or proposed marine ferry development or road development. It should explore all environmental impacts on wetlands, waterways, flora, fauna, and human, including health studies as well as air and noise impacts. All impacts in the Northeast must be addressed and a plan developed to determined the least invasive environmental impacts for developments needed to meet not just Massachusetts requirements but the entire North East the region's requirements for future long term growth. This Airside Improvement Study is only one element of the Project and should not be permitted until the landside and regional impacts are included. Segmental planning cannot and should not be tolerated.

The MPA makes the claim in their transmission letter of February 19, 1999 that, "...the lapse of time between the publication of the ENF and the publication of notice availability of this Draft EIR **has no adverse environmental consequences..."** This is blatantly untrue. Weather conditions alone have dramatically changed over the last five years because of the El Nino and La Nina effects. FAA delay data (DELAYSIM) shows that Logan's delay situation has improved since 1993 and is essentially in equilibrium. The entire analysis in the document needs to be updated. 230.4

I urge the Secretary and FAA to require the MPA to change the base year for planning for the project to calendar year 1998, to revise all presentations in the DEIS/DEIR, including the appendices thereto to reflect the changes and to extend the planning period to 2020 from 2010 with concomitant revisions in projected levels of activity and impact and to require that the DEIS/DEIR be republished.

Massport has not met the requirements of the National Environmental Policy Act (40 CFR Part 1502 Environmental Impact Statements) that requires:

1. the DEIS/DEIR to "Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated."[1]
   I would expect the DEIS/DEIR alternatives to include, but not be limited to, the following:
   - a: Development of a new airport,
   - b: Consideration of Implementing a High-Density Rule (Slots)
   - c: Consider Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan to provide noise relief to affected communities, and.
   - d: A thorough regional transportation plan, including rail, and all environmental impacts.

   230.5

2. regarding methodology and scientific accuracy, that, "...They shall identify any methodologies used and shall make explicit reference by footnote to the scientific and the sources relied upon for the conclusions in the statement."[2]
   The DEIS/DEIR does not indicate the detailed methodology used to develop the levels of passenger forecasts presented

---

[1] Council on Environmental Quality, 40 CFR Part 1502.14(a)

[2] Council on Environmental Quality, 40 CFR Part 1502.24

3. the environmental consequences regarding the following, "The discussion will include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, the relationship of long-term productivity, and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented. It shall include discussions of: ...(g) Urban quality, historic and cultural resources, and the design of the built environment..."[3]

The DEIS/DEIR discusses the preferred alternatives effect on historic districts but does not comment on the urban quality, or the design of the built environment. Although Peak Hour Pricing in Alternate 1 clearly shows to be the most beneficial for delays and thus, noise reduction, the MPA continues not to consider this alternative except as a future option.

4. "An agency shall commence preparation of an environmental impact statement as close as possible to the time the agency is developing or is presented with a proposal (PP 1508.23) so that preparation can be completed in time for the final statement to be included in any recommendation or report on the proposal. The statement shall be prepared early enough so that it can serve practically as an important contribution to the decisionmaking process and will not be used to rationalize or justify decisions already made." PP 1508.23 describes a proposal as the following: " 'Proposal' exists at the stage in the development of an action when an agency subject to the Act has a goal, is actively preparing to make a decision on one or more alternative means of accomplishing that goal, and the effect can be meaningfully evaluated."[4]

230.5 (cont.)

The ENF Certificate was issued November 22, 1995. The MPA and the FAA have not complied with the required timing of the DEIS/DEIR document. Furthermore, the analysis uses baseline data of 1993 for a document submitted in 1999. Weather, as well as aircraft and major regional infrastructure and developments have occurred to the point where a 1998 base year should be required.

A lack of "reasonable alternatives" exists because of the lack of assessment of either Hanscom (no mention of this Massachusetts Port Authority owned and operated airport in the document) or a second major airport or other, the possible diversion of cargo to another airport, and the documentation of history of PRAS and the problems of implementation. Further, I do not believe that the metropolitan Boston communities cannot continue to absorb the landside growth that would accompany the proposed airside growth at the airport.

I believe there should be a detailed analysis of the causes of the delays in the document which show aircraft mechanical problems, crew caused delay, and weather causes both at Logan and those caused by weather at other airports. The documented analysis is outdated and inadequate.

230.6

Lowering of the minimum on runway 22L is an additional concern, particularly, for the near in neighborhood of the Saratoga Street area of East Boston. Not only does this allow for an increased

---

[3] Council on Environmental Quality, 40 CFR Part 1502.16

[4] Council on Environmental Quality, 40 CFR Part 1502.5

number of flights to land at Logan Airport, it also will spread the noise from the missed approach aircraft more horizontally thus impacting the neighborhood at the end of runway 22L with increased noise. Nor does it take into account the fact that the noise created by "spooling up" adversely affects neighborhoods far behind the aircraft. Further computer modeling does not present the real life occurrence in the surrounding communities and a more accurate analysis needs to be done. Communities constantly challenge the 65 db contour lines with regards to soundproofing and which does not include air conditioning, but does require that a residence meet current code specifications. This can cause financial stress on the already noise impacted residents. 230.7

The proposed Centerfield taxiway between runways 4L/22R and 4R/22L leads to further increased operations at Logan Airport and increased noise for the close in residents of Winthrop, Revere, and East Boston. This Taxiway will allow for additional queuing of aircraft very close to the surrounding neighborhoods and Constitution Beach, increased operations which will increase noise and further degrade of the quality of life for these residents. 230.8

Boston as an historic city will suffer the brunt of negative impacts from the proposed Project and will lose a quality of life that will never be recaptured! The additional number of flights, as well as increased traffic, that the Project would allow and encourage will do irreparable harm to the historic city of Boston and the greater metropolitan area. Development of high speed rail connections to other airports and the connection of Boston's two rail stations with the North/South Rail Link could help reduce these impacts. Convention locations and tourist destinations are not determined by the accessibility of an airport, rather they are determined by the quality of the experience of the location. No other major city around the world has had loss of tourists or conventions because of the convenience or inconvenience of the locality's airport. For the MPA to claim that the additional runway and centerfield taxiway are needed for the proposed new convention center is nothing more than an exaggeration. Time and again the MPA has claimed the need for the Project for the good of the city of Boston. With the proposed growth for Logan Airport needless adverse impacts will continue to grow over one of the most historic cities in the country Mayor Menio does not agree with the MPA hypothesis and neither do I. 230.9

Massport and the FAA state "when dealing with an existing airport (such as Logan Airport) within an urban setting (such as metropolitan Boston), any change in operating conditions aimed at more equitably distributing noise impacts (here, in accordance with the PRAS goals) may result in some increase in noise at specific historic areas while at the same time decreasing noise at other historic areas."[5] I believe that changes to Logan's operating conditions are not any more important than the cultural, historical and urban quality of life in the metropolitan Boston area.

The state listed endangered upland sandpiper habitat which would be disrupted by Centerfield Taxiway is not adequately addressed and there is no agreement with the Massachusetts Natural Heritage and Endangered Species Program although this has been a known area of concern since 1993. 230.10

A primary concern of mine is for the newly created Boston Harbor Islands National Recreation Area is the proposed construction of runway 14/32 and the resultant 75,000 proposed flights over the newly created Boston Harbor Recreational Area. This impact, one of environmental injustice, would

[5] DEIS/DEIR Section 8.6.1.2 "Assessment of Impact"

occur to mostly inner city residents who frequent the islands to get away from the noise and hubbub of city life. This is, and should continue to be, a time for them to experience nature, to hear and smell the harbor and study the skies. These sensory experiences would be severely impacted by the exorbitant number of flights over the harbor. I spend a great deal of time in on the harbor and on the islands. Aiplane noise is already an interruption, 75,000 planes a year will be intolerable.

Children from school groups, Boy and Girl Scout troops, Inner City Outings groups, and many other groups camp and explore the islands and enjoy learning experiences from the skies to the flora and fauna of the islands to the marine life and water quality. All of this will be degredated by the subject project. 230.11

The roar of the overhead planes will make a camping experience a horror rather than the wonderful enjoyment of sleeping under the stars. The fuel emissions and dumping from the airplane engines will contaminate the islands and the wildlife, not to mention the humans who will be much more exposed by being out of doors rather than at home or work.

In conclusion, I see this proposed Project as the first step in further major development at Logan airport There is also no guarantee of the unidirectional use of the proposed 14/32 runway, and I request that due to the the lack of future plans and analysis for the airport over the next 20 years that the current document be declared inadequate. In addition, the public has not been given fair consideration of the proposed Project. It is merely an interim solution to a much bigger and more complex problem which must be addressed before allowing the project to go forward. Further the projected growth of jet operations is horrifying. Other alternatives must be assessed. The possibility of the "New Large Aircraft" (NLAs)[6] has not been mentioned or addressed and is frightening for those of us who live in such close proximity to the airport.

Because none of the above mentioned impacts has been adequately addressed or, in some cases, even mentioned in the DEIS/DEIR, I am requesting that the Massachusestts Secretary of Environmental Affairs and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed, that the document be found "INADEQUATE" and that a new Draft document be required

Thank you for this opportunity to comment.

Very truly yours,

Ethan D. Hoag

230.1	Environmental Review Process	MEPA	... Each of the major three parts; the proposed runway 14/32, the centerfield taxiway between the 4/22 runways, and lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed. In addition, the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to 2020.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.
230.2	Environmental Review Process	FAANEPA, MEPA	[There is a] conflict of interest that exists for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. ...	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
230.3	Regional Transportation	Regional Airports	A comprehensive northeast regional transportation plan, including all forms of transportation, should be developed and put in place before any airport expansion is allowed...[This plan would determine] the least invasive environmental impacts and developments needed to meet not just Massachusetts requirements but the entire North East the region's requirements for future long-term growth.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
230.4	Delay	Model	[The DELAYSIM study is outdated, uses incomplete data and needs to be redone, including using 1998 as the base year and project volume to the year 2020.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. The DELAYSIM model represents the most precise model developed to date for measuring delay at Logan Airport. FLAPS and DELAYSIM have been discussed in Section 4.4 of the Supplemental DEIS/FEIR. These models were originally developed for Logan Airport under Massport and FAA funding, and have been used in airport planning studies in the United States and internationally.

Code	Topic 1	Topic 2	Comment	Response
230.5	Environmental Review Process	FAA/NEPA	Massport has not met the requirements of the National Environmental Policy Act [by failing to]: ... "Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." "...identify any methodologies used and shall make explicit reference by footnote to the scientific and the sources relied upon for the conclusions in the statement." ... "...include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, ..." [Prepare an environmental impact report in a timely manner.]	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons.
230.6	Delay	Methodology	...[T]here should be a detailed analysis of the causes of the delays in the document which show aircraft mechanical problems, crew caused delay, and weather causes both at Logan and those caused by weather at other airports. The documented analysis is outdated and inadequate.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
230.7	Environmental Justice	Impacts	[Lowering the minimum on Runway 22L will adversely effect the adjacent neighborhood. The report fails to consider noise created by aircraft "spooling up".]	The noise model *does* account for the noise at the start of takeoff roll as pilots advance their throttles and begin to accelerate down the runway for takeoff. It also includes a correction for higher than normal thrust observed during the final approach to land as well as a short application of thrust reversers after landing. All three factors effectively account for "spooling up".
230.8	Noise	Impacts	[The proposed taxiway will increase noise in Winthrop, Revere and East Boston.]	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today no would occur in the future if no action is taken. PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere.

Code	Topic 1	Topic 2	Comment	Response
230.9	Regional Transportation	Passenger Rail	[Boston will suffer the majority of impacts associated with this project. The increased number of flights will do irreparable harm to the city and the whole metropolitan area. High speed rail connections from Boston to regional airports is a better solution.]	Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
230.10	Ecosystems	Rare species	[Impacts to the endangered upland sandpiper habitat have not been adequately addressed.]	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport associated with construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat totaling approximately 150 acres at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far in excess of the 40± acres to be lost at Logan Airport. A Memorandum of Agreement has been signed between Massport and the Massachusetts Army Air National Guard for implementation of the program and long-term maintenance of the area as Upland Sandpiper habitat. Additional details of the Upland Sandpiper mitigation plan are presented in Section 8.5 of the Supplemental DEIS/FEIR.
230.11	Environmental Justice	Impacts	[The increased flights over the Boston Harbor National Recreation Area would mostly affect inner city residents.]	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative. Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative.

Re: Massachusetts Port Authority (MPA)
Logan Airside Improvements Planning Project ("Project")
Boston-Logan International Airport
Boston/Winthrop

Gentlemen:

I strongly request that the Massachusetts Secretary of Environmental Affairs, Secretary Durand, (the Secretary) and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed, that the document be found "INADEQUATE" and that a new Draft document be required. Each of the major three parts; the proposed runway 14/32, the centerfield taxiway between the 4/22 runways and, lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed. In addition, the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to 2020. 231.1

I also want to go on record concerning the conflict of interest that exists for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. I request that the EPA take the lead role for this decision because of the conflict. 231.2

A comprehensive northeast regional transportation plan, including all forms of transportation, should be developed and put in place before any airport expansion is allowed. This should be accomplished with the cooperation of all interested parties, including, but not limited to, residents, businesses, and organizations. It should also analyze all impacts, including airside and landside at airports, track right of ways and adjacent properties for rail, any new planned or proposed road development, and all environmental impacts on wetlands, waterways, flora, fauna, and human, including health studies as well as air and noise impacts. All impacts in the Northeast must be addressed and a plan developed to determined the least invasive environmental impacts for developments needed to meet the region's requirements for future long term growth. This Airside Improvement Study is only one element of the Project and should not be permitted until the landside and regional impacts are included. Segmental planning cannot and should not be tolerated. 231.3

The MPA makes the claim in their transmission letter of February 19, 1999 that, "...the lapse of time between the publication of the ENF and the publication of notice availability of this Draft EIR **has no adverse environmental consequences...**" This is blatantly untrue Weather conditions alone have dramatically changed over the last five years because of the El Nino and La Nina effects. FAA delay data (DELAYSIM) shows that Logan's delay situation has improved since 1993 and is essentially in equilibrium. The entire analysis in the document needs to be updated.

areas."[5] I believe that changes to Logan's operating conditions are not any more important than the cultural, historical and urban quality of life in the metropolitan Boston area.

The state listed endangered upland sandpiper habitat which would be disrupted by Centerfield Taxiway is not adequately addressed and there is no agreement with the Massachusetts Natural Heritage and Endangered Species Program although this has been a known area of concern since 1993. 231.4

A primary concern of mine is for the newly created Boston Harbor Islands National Recreation Area is the proposed construction of runway 14/32 and the resultant 75,000 proposed flights over the newly created Boston Harbor Recreational Area. This impact, one of environmental injustice, would occur to mostly inner city residents who frequent the islands to get away from the noise and hubbub of city life. This is, and should continue to be, a time for them to experience nature, to hear and smell the harbor and study the skies. These sensory experiences would be severely impacted by the exorbitant number of flights over the harbor. I spend a great deal of time in on the harbor and on the islands. Aiplane noise is already an interruption, 75,000 planes a year will be intolerable.

Children from school groups, Boy and Girl Scout troops, Inner City Outings groups, and many other groups camp and explore the islands and enjoy learning experiences from the skies to the flora and fauna of the islands to the marine life and water quality. All of this will be degredated by the subject project.

The roar of the overhead planes will make a camping experience a horror rather than the wonderful enjoyment of sleeping under the stars. The fuel emissions and dumping from the airplane engines will contaminate the islands and the wildlife, not to mention the humans who will be much more exposed by being out of doors rather than at home or work.

In conclusion, I see this proposed Project as the first step in further major development at Logan airport There is also no guarantee of the unidirectional use of the proposed 14/32 runway, and I request that due to the the lack of future plans and analysis for the airport over the next 20 years that the current document be declared inadequate. In addition, the public has not been given fair consideration of the proposed Project. It is merely an interim solution to a much bigger and more complex problem which must be addressed before allowing the project to go forward. Further the projected growth of jet operations is horrifying. Other alternatives must be assessed. The possibility of the "New Large Aircraft" (NLAs)[6] has not been mentioned or addressed and is frightening for those of us who live in such close proximity to the airport.

Because none of the above mentioned impacts has been adequately addressed or, in some cases, even mentioned in the DEIS/DEIR, I am requesting that the Massachusestts Secretary of Environmental Affairs and the FAA determine that significant planning deficiencies exist in the DEIS/DEIR of the Logan Airside Improvements Planning Project ("Project") that must be addressed, that the document be found "INADEQUATE" and that a new Draft document be required

Thank you for this opportunity to comment.

Very truly yours,

M. Blossom Hoag

231.1	Environmental Review Process	MEPA	... Each of the major three parts; the proposed runway 14/32, the centerfield taxiway between the 4/22 runways, and lowering of the minimum have major environmental impacts for the greater Boston metropolitan area which have not been adequately addressed. In addition, the data and studies used are outdated and a 1998 base year should be required with the planning period extended from 2010 to 2020.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates. In response to the request made by the EPA, as well as by EOEA in its MEPA Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. Current traffic trends at Logan Airport, as described in the Supplemental DEIS/FEIR, indicate that the 37.5 million annual air passenger level may not be reached until 2015, and the 45 million passenger level may not occur until 2020 or beyond. The planning horizon considered in the airside analysis therefore extends well beyond 10 years. Chapter 2 of the Supplemental DEIS/FEIR addresses the integration of the Airside Project and regional transportation.
231.2	Environmental Review Process	FAA/NEPA	[There is a] conflict of interest that exists for the FAA to be a proponent for the Project and then also one of the decision makers in determining the Project's adequacy. ...	Comment noted.
231.3	Regional Transportation	Regional Airports	A comprehensive northeast regional transportation plan, including all forms of transportation, should be developed and put in place before any airport expansion is allowed. ...[This plan would determine] the least invasive environmental impacts for developments needed to meet the region's requirements for future long term growth.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
231.4	Ecosystems	Rare Species	The state listed endangered upland sandpiper habitat which would be disrupted by Centerfield Taxiway is not adequately addressed and there is no agreement with the Massachusetts Natural Heritage and Endangered Species Program although this has been a known area of concern since 1993.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport associated with construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat totaling approximately 150 acres at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far in excess of the 40± acres to be lost at Logan Airport. A Memorandum of Agreement has been signed between Massport and the Massachusetts Army Air National Guard for implementation of the program and long-term maintenance of the area as Upland Sandpiper habitat. Additional details of the Upland Sandpiper mitigation plan are presented in Section 8.5 of the Supplemental DEIS/FEIR.

LETTER 232

Mr. Robert Durand
c/o Mr. Arthur Pugsley
MEPA Unit
Executive office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02202
EOA - 10458

East Boston and surrounding communities deserve environmental justice. Mr. Durand, as head of the Massachusetts Environmental Protection Agency, you must support our efforts to stop the expansion of Logan International Airport. Logan is already too crowded with ground and air transportation. This congested area can not be expected to accept the entire burden for Massachusetts air traffic.

Runway expansion as a solution to Logan's over crowding demonstrates the Massachusetts Port Authority's lack of a progressive agenda. Other major cities have built airports away from the city center and the cities have not suffered. Dulles, Newark, and LaGuardia have not diminished the people entering the New York or Washington area. The continued growth of Logan can not be the answer. A new solution is needed.

Massport's planned growth of Logan is short sighted and based on misrepresentations. Their studies show expansion as a solution. Their studies also show the following:

- As part of the Massport soot study, I was informed that I had brake dust from the cars at the Sumner Tunnel in my backyard. My home is more than 2 miles from the Sumner Tunnel but the rear of my house faces the 4L runway.
- In volume 1 page 2-9, Hanscom is not listed in the map of commercial airports. Massport does not consider this airport commercial, but it should be listed and included in the planning as 57.2% of flight demand is based outside the 128 and 495 area. Before any expansion of Logan is activated, Worcester airport should be brought up to it's full potential. 232.1
- The change in height decision, volume 3 page 4, was based on a graph that shows Saratoga Street as the last street before the water. There are two additional residential streets between Saratoga Street and the water. Bayswater Street and St. Andrew Road were not even considered. 232.2
- In the change in height decision graphs the water between Bayswater Street and the Airport is referred to as Boston Harbor. However, in Massport's Buffer Graph for the Bayswater Street area the above mentioned body of water is referred to as Boston Inner Harbor Tidal basin. Massport changes the name of the area to whatever will suit their objectives best.
- Charts and graphs used by the Massport never show surrounding homes or schools. Accurate information would demonstrate the closeness to thickly settled residential areas. It would also show the fact that if planes abort, the engine thrust would be aiming directly at homes. 232.3
- Massport claims pollution will be less with the centerfield taxiway, when all of the exhausts from planes using this taxiway will be aimed at the Bayswater Street homes. The main objective of the centerfield taxiway is to get the planes away from the gates. 232.4
- Regulations for the November Taxiway have been disregarded. A maximum of five large jet aircrafts are permitted on the taxiway at a time, however there are times when 10 to 15 large jets are lined up. Massports reply to complaints are "*we need to*". Regulations and social responsibility are forgotten for the pursuit of more air movement. 232.5

Massport will do anything to get 14-32 implemented. Currently the amount of money being spent to promote the new runway is absurd. I was shocked to hear Boston Edison is a contributor for the Massport

television advertisements. I did not realize public utilities could use money from rate payers to lobby for airport expansion. Local concerned citizens can not compete with the corporate media blitzes. The Massport is also asking employees to support the proposed expansion. Through intimidation many local Massport employees will support the runway.

As shown above the Massport has misrepresented information and disregarded policies. We can not believe 14-32 will be unidirectional or this is all the expansion needed. Money and growth are all Massport is interested in. We need the help of the Massachusetts Environmental Protection Agency to stop Massport. People living in the Boston area should have the same environmental rights as the rest of the state. We have the right to breathe fresh air, enjoy a summer day, be able to smell the flowers, not the fumes and hear birds sing, not airplanes taking off. This can not be accomplished without your help. Please stop Massport's plans for expansion.

Thank you for your help in this very important matter.

Sincerely,

Roberta T. Horn

232.1	Regional Transportation	Regional Airports	In volume I page 2-9, Hanscom is not listed in the map of commercial airports. Massport does not consider this airport commercial, but it should be listed and included in the planning as 57.2% of flight demand is based outside the 128 and 495 area.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
232.2	Alternatives	Reduced Approach Minima	The change in height decision, volume 3 page 4, was based on a graph that shows Saratoga Street as the last street before the water. There are two additional residential streets between Saratoga Street and the water. Bayswater Street and St. Andrew Road were not even considered.	Graphics have been updated, supplemented and corrected.
232.3	Noise	Studies	Charts and graphs used by the Massport never show surrounding homes or schools. Accurate information would demonstrate the closeness to thickly settled residential areas.	The noise exposure contours and basemaps presented in Chapters 5 and 6 all show residential areas. Additional blow-ups of specific areas depict cultural resources, historic districts, and parklands. Schools are shown in Appendix E of the Supplemental DEIS/FEIR on a basemap with school day noise exposure contours.

Code	Topic 1	Topic 2	Comment	Response
232.4	Alternatives	Taxiway Improvements	Massport claims pollution will be less with the centerfield taxiway, when all of the exhausts from planes using this taxiway will be aimed at the Bayswater Street homes.	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
232.5	Alternatives	Operational Restrictions	Regulations for the November Taxiway have been disregarded.	The Centerfield Taxiway will provide more flexibility for air traffic controllers to handle ground movements.

LETTER 233

Susan M. Horn
65 St. Andrew Road
East Boston, MA 02128-1223

Mr. Arthur Pugsley
MEPA Unit
Executive Offices of Environmental Affairs
100 Cambridge Street 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

RE: File # EOA10458

I have lived at the above address all my life. In December, 1996 (at the age of 34) I was diagnosed with environmental asthma. Whilst I can not blame the cause of my asthma specifically on the airport, I can certainly attest that the heavy fumes coming from the airport greatly affects my condition particularly in the warmer months, when I am outside more often. I can not go outside without the need to hold my breath or the need to adjust my breathing because I have an attack. Living in the city I have been able to adapt my breathing in certain circumstances. However if added pollutants are added to the mix, I am concerned for my health when I am outside. I should not be a prisoner in my home due to Massport's inability to not plan ahead. I like living where I live and should not be penalized because Massport can't come up with a fair and reasonable plan that won't burden one specific area.

The MDC is enhancing Constitution Beach making it a nice place to bring the family in the hot summer months with the increase of airplanes people will not be able to enjoy this recreation without getting blasted with fumes from the taxiing airplanes. People bring children to the beach. The children not to mention the adults are currently breathing in these fumes which contain toxins. To have an increase of fumes for children and adults to breathe is not healthy. Massport seems to be very concerned about the wildlife to the tune of $250,000. The increase of planes can not be advantageous to the other birds and sea life that depends on the area to survive. They are willing to take care of the Upland Sandpiper with total disregard to the human inhabitants of the area. 233.1

The utter neglect at looking at this problem as regional and burdening one section of the area is unfair consideration. The entire region reaps the advantages of Logan but yet only a small section of the region is expected handle the burden of noise from flight traffic and land traffic; pollutants from both ground and air vehicles not to mention the speeding cars through the neighborhoods. These neighborhoods for the most part are not affluent and many are quite poor with a minority base. The skies over Logan are getting too crowded 233.2

and with the increased air traffic comes a greater risk of accidents. Remember as with a gallon of milk once it is filled to a gallon no more milk can be added with out spillage and this is what will happen to the affected areas. The more milk added after the gallon container has been filled the greater the mess. The skies around Logan Airport are that filled gallon of milk.

At what point is quality of life and human health and welfare worth less than someone's inconvenience? Life is full of delays: Last minute phone calls in the office: Break down in the tunnel or on the road: Personal happenings. The people who make the Greater Boston Area is what makes Boston a great place to visit by destroying the communities there will be a lost charm to the area.

The report that is currently before you omit several key factors: 1.) Regarding lowering of the minimum the last street on the reference chart is Saratoga Street. There are two streets after that St. Andrew Road and Bayswater Street. 2.) Massport fails to state what will happen when the delays that 14/32 is supposed to curtail increases surpassing the delay times that currently exists. They admit that in the two to three years after completion of this runway the delays will be the same or worse than today. 3.) Massport is also touting this as a unidirectional runway; however, Massport can not make this promise. This is a FAA decision and despite all these promises of being severely penalized if Massport does use it for other directions because of the FAA's ok then the penalties will be a mute point. 233.3 233.4

I went to both of the meetings held on April 7th and 8th. It is apparent that the business people who in all likelihood do not live in the affected areas are for the runway, centerfield taxiway and the lowering of the minimum. The residents of the affected area are astoundingly against the expansion in any form. It is the EPA's responsibility to protect the residents of this affected area from those who want to destroy our quality of life. Please do so.

I thank you for your time and consideration in this matter.

Sincerely,

Susan M. Horn

Code	Topic 1	Topic 2	Comment	Response
233.1	Air Quality	Impacts	[The proposed expansion and resulting increase in toxic fumes will effect the health of people using Constitution Beach. Massport is willing to spend $250,000 to move sandpipers, what about the human inhabitants?]	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.
233.2	Environmental Justice	Impacts	[A small section of the metropolitan area bears the brunt of the impacts from Logan while the whole area enjoys the benefits. Those bearing the burden are the poor and minorities.]	Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.
233.3	Alternatives	Reduced Approach Minima	[The decision to lower the minimum for Runway 14/32 ignores potential impacts to residents on St. Andrew Road, Bayswater Street and Saratoga Street.]	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.

Code	Topic 1	Topic 2	Comment	Response
233.4	Alternatives	Runway 14/32	Massport is also touting this as a unidirectional runway; however, Massport cannot make this promise. This is a FAA decision...	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.

LETTER 234

159 Trenton Street
East Boston, MA 02128
March 21, 1999

MEPA and FAA:

The siege Massport is waging upon East Boston and surrounding communities is no less historic than British threats to burn Boston. Their determination to build Runway 14/32, regardless of the devastating environmental and social impacts, is like the shot heard around the world. The pollution and noise, resulting from thousands of increased jet aircraft operations, promises to create intolerable living conditions. Massport expects us to close our windows, retreat into some imaginary soundproof cubicle; in effect, to be held prisoners within our own homes. Quality of life is the issue; without it a healthy community cannot exist. 234.1

East Boston is experiencing a rebirth. Restoration and renewal are ongoing activities throughout the community. Future development of our precious waterfront is carefully being studied. The main street initiative is spawning new vitality. Green space, an important ingredient for every flourishing urban environment, is taking root. The Eagle Hill area has recently achieved long over due recognition as an important historic site and is now listed on the National Register of Historic Places. Residents are excited with the developments and are deciding to stay and rebuild their neighborhoods.

Massport and supporting business leaders tout an economic boon throughout the area. NOT TRUE! Airport expansion in other areas of the country where quality of life was ignored does not economically benefit affected communities. Instead, people move out, real estate values plummet, businesses suffer and crime rates increase. In short, many abutting and affected areas slump into depression and decay. The only "economic boon" belongs to Massport whose revenue producing design further encroaches upon our treasured island. 234.2

Massport claims that building 14/32 would reduce Logan congestion and be environmentally benign, or even beneficial. This statement merely reflects one of many dishonest assessments Massport is promoting. Thousands of increased jet aircraft operations is NOT environmentally friendly, nor will congestion be relieved. Taxpayer funding should not be required to arrive at such an obvious conclusion. Massport even admits that shortly after the runway is completed delays will return to the same levels. In other words, Massport and Governor Cellucci are willing to

devastate the health, sanity and well being of all the surrounding communities for a project which will benefit virtually no one.

It's been reported in the Globe that Massport plans on launching a media blitz using "soft-sell" ads and "strategies of the 90's" to build public and political support. It's quite apparent in the national arena that "strategies of the 90's" consists of attempts to deceive, cover-up and lie in order to sway opinion. The fact is Massport and their political cronies will do and say anything to achieve their designs. Be forewarned, we in the surrounding communities are not so easily deceived.

Noise levels are presently unbearable from aircraft operations over Eagle Hill. Adding thousands more atop this National Historic Site is an appalling abuse of morality. It's time to face the fact that Logan is already saturated and set in motion peak hour pricing and slot allocation. This will achieve long term delay-reduction far better than building runway 14/32. There will always be delays. New England weather will continue to create airport disruptions regardless of how many runways are built. Long range planning should focus on selecting an alternate airport. 234.3

In short, stop killing us with deafening noise and pollution. We're not going to sit idly and allow our lives to be destroyed by the self-serving interests of Massport, Governor Cellucci and their obsequious confederates. Governor Cellucci recently stated prior to his operation, "It's a matter of **quality of life**". Isn't it strange that he considers his quality of life important but not the thousands of residents adversely affected by airport expansion. Boston is renowned for struggling against tyranny. Once again we are faced with forced servitude and will rise to the occasion. NO MORE NOISE! NO MORE POLLUTION! 234.4

Sincerely yours,

Craig L. Jolliffe

234.1	Public Health	Effects	The pollution and noise, resulting from thousands of increased jet aircraft operations, promises to create intolerable living conditions.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.
234.2	Alternatives	Impacts	[East Boston has recently undergone some significant rebirth and renewal. The proposed airport expansion will counteract that by driving people out of the community.]	Comment noted.
234.3	Alternatives	Peak Period Pricing	It's time to face the fact that Logan is already saturated and set in motion peak hour pricing and slot allocation. This will achieve long term delay-reduction far better than building Runway 14/32.	Neither federal nor state scoping directives required an analysis of slotting. Imposition of slot controls constitutes a federal policy that has been preempted to the FAA under federal law and is not within Massport's jurisdiction. Congress determined that the slot program has a number of significant problems. The U.S. DOT has studied options for reducing slot controls at airports. As a result, the AIR-21 Act, which was enacted in March 2000, eliminates all slots at three of the nations slot controlled airports. Slots at the Chicago O'Hare airport will be eliminated by July 1, 2002 and slots at New York LaGuardia and New York JFK will be eliminated by January 1, 2007. PPP represents a market approach that should encourage the highest value services to use Logan Airport during periods of scarce capacity without the market disruption and other inefficiencies related to slot control. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport, and provides an assessment of the extent of the benefits of PPP under such circumstances. See Section 4.5 of the Supplemental DEIS/FEIR.
234.4	Regional Transportation	Regional Airport	Long range planning should focus on selecting an alternate airport.	A second major airport is not a solution to the current delay and congestion problems at Logan Airport. The Proposed Project to reduce delay and enhance safety at Logan Airport must be implemented in the near term to address current and future operating conditions

A VISION FOR LOGAN AIRPORT

More Noise? More Pollution?

What will more noise do to our historic as well as our modern neighborhoods? What will more noise do to our harbor recreation involving boating, swimming, fishing, wildlife and island play areas? 235.1

Let us not wreck our beautiful world famous landmark known as Boston. As was done at the Regan International Airport in Washington, D.C., can we create and maintain a beautiful small airport which will complement our beautiful city while allowing recreation, work, transportation, and even wildlife to have a reasonable access to the city, harbor, harbor islands, and ocean.

As in D.C., Boston has no room to expand. As in D.C., Dulles and Baltimore Airports alleviate the congestion. We can alleviate congestion with not only Manchester and Green Field Airports but also include Worcester and the 128 Air Force Base. We must nurture our present airport and make it fit in with and work to support our present roads, parks, neighborhoods, and work places. 235.2

This plan will make Boston Better!

Dear Mr Lamont,
We cannot noise-proof the boat & recreation areas. Please consider the total tourist package known as "Boston"
Sincerely, Gil & Bonnie Lavoie

235.1	Noise	Impacts	What will more noise do to our historic as well as our modern neighborhoods? What will more noise do to our harbor recreation involving boating, swimming, fishing, wildlife and island play areas?	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.. The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
235.2	Regional Alternatives	Regional Airports	We can alleviate congestion with not only Manchester and Green Field Airports but also include Worcester and the 128 Air Force Base.	Noise data were acquired in Roxbury for the tests of the Runway 27 departure procedure in the winter of 1991 to 1992. These data indicated a reasonable correlation between measurement and modeling based on the radar tracks. In 1997, a permanent noise monitor was installed in the Boston Latin Academy in Roxbury under the new flight path. The data for part of 1997 were reported in the 1997 Annual Update in Table 5-5, and the data for 1998 were reported in the 1998 Annual Update in Table 5-6. The 1998 data show both the total noise and the total noise from aircraft, as well as the INM-calculated values of DNL. The agreement is excellent.

Secretary of Environmental Affairs
Attention Mr. Arthur Pugsley-MEPA Office
100 Cambridge Street 20th Floor
Boston, MA 02205

RE: EOEA No. 10458

Dear Mr. Pugsley:

As an attorney and lifelong resident of the East Boston community, I write to voice my opposition to the above referenced project and ask that my comments be recorded in the negative.

In 1995, the Massachusetts Port Authority (Massport) filed their Environmental Notification Form (ENF) with the Massachusetts Secretary of Environmental Affairs, officially commencing the environmental review process to construct a new runway and centerfield taxiway at the General Edward Lawrence Logan International Airport. The need for such construction, as cited by Massport, was to improve efficiency and reduce delays at the nation's 13th busiest airport. As most of us who live in the surrounding communities already know, Logan is situated on land ill suited to house the nation's 13th busiest bus terminal, never mind an international airport. Although Massport's plan to construct a new runway intends to place less flights over the surrounding communities, their approach serves only as a band aid solution to a bigger problem.

Massport predicts that passenger growth at Logan will increase from its current 25 million passenger to anywhere from 35 to 45 million passengers by the year 2010. Furthermore, operations at Logan, which currently peak at 120 per hour, are expected to increase as well. While Massport cites that the need for a new runway at Logan is to help solve efficiency problems, a better solution might be one that contemplates Massport's capacity problems.

Since Massport's feasibility study and ENF were released in 1995, the popularity of regional airports has soared dramatically. The success of airports like T.F. Green in Providence Rhode Island and Manchester Airport in New Hampshire are testament that regional commuters will use airports other than Logan to avoid delays, traffic, and to save money. However, Massport continues to ignore a second major airport as an alternative to reducing delays at Logan. 236.1
